

# IC for Headphone Stereos

## Monolithic IC MM1376

### Outline

This IC was developed for use in 3V headphone stereos, and combines all the basic audio circuitry for headphone stereos on a single chip.

Recently hearing impairment caused by the high volumes of headphone stereos has become a problem, and there has been strong demand for functions for limiting loud volumes in the sets themselves. This IC incorporates an ALC circuit and has functions to hold the output from the headphone to a fixed level; it also eliminates the ordinary electronic governor circuit in order to accommodate trends toward thinner sets, as seen in the adoption of BSL motors.

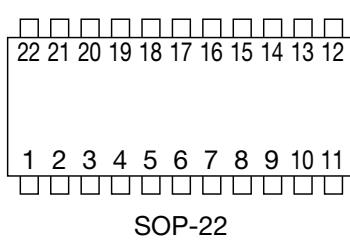

### Package

1. Configuration: Pre-and power amps, ALC circuit
2. Internal tape selector: A selector switch allows the user to select between normal and metal tapes.
3. Internal OCL circuit: No need for large-capacitance output capacitor
4. Preamp off function: Preamp alone can be turned off for connection to radio etc.
5. MM1376CF amp gain takes Dolby noise reduction into account

### Package

SOP-22

### Pin Assignment

<b>1</b>	COM1	<b>12</b>	Power output
<b>2</b>	Preamp non-inverted input	<b>13</b>	Vcc
<b>3</b>	Preamp inverted input	<b>14</b>	Ripple filter
<b>4</b>	Metal switching output	<b>15</b>	Preamp off
<b>5</b>	Preamp output	<b>16</b>	Tape selector
<b>6</b>	Power input	<b>17</b>	Power input
<b>7</b>	Rectifier pin	<b>18</b>	Preamp output
<b>8</b>	ALC control	<b>19</b>	Metal switching output
<b>9</b>	Power output	<b>20</b>	Preamp inverted input
<b>10</b>	COM2	<b>21</b>	Preamp non-inverted input
<b>11</b>	GND1	<b>22</b>	GND2

### Absolute Maximum Ratings
