

ML6554

3A Bus Termination Regulator

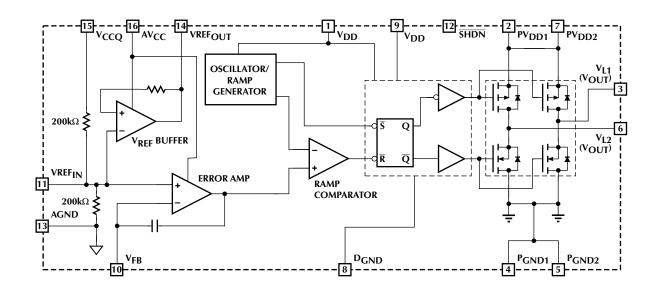

GENERAL DESCRIPTION

The ML6554 switching regulator is designed to convert voltage supplies ranging from 2.3V to 4V into a desired output voltage or termination voltage for various applications. The ML6554 can be implemented to produce regulated output voltages in two different modes. In the default mode, when the V_{REF} pin is open, the ML6554 output voltage is 50% of the voltage applied to V_{CCQ}. The ML6554 can also be used to produce various user-defined voltages by forcing a voltage on the VREF_{IN} pin. In this case, the output voltage follows the input VREF_{IN} voltage. The switching regulator is capable of sourcing or sinking up to 3A of current while regulating an output V_{TT} voltage to within 3% or less.

The ML6554, used in conjunction with series termination resistors, provides an excellent voltage source for active termination schemes of high speed transmission lines as those seen in high speed memory buses and distributed backplane designs. The voltage output of the regulator can be used as a termination voltage for other bus interface standards such as SSTL, CMOS, Rambus[™], GTL+, VME, LV-CMOS, LV-TTL, and PECL.

FEATURES

- Power SOP package
- Can source and sink up to 3A, no heat sink required
- Integrated Power MOSFETs
- Generates termination voltages for SSTL-2 SDRAM, SGRAM, or equivalent memories
- Generates termination voltages for active termination schemes for GTL+, Rambus, VME, LV-TTL, PECL and other high speed logic
- V_{REF} input available for external voltage divider
- Separate voltages for V_{CCQ} and PV_{DD}
- Buffered V_{REF} output
- V_{OUT} of ±3% or less at 3A
- Minimum external components
- Shutdown for standby or suspend mode operation
- Thermal Shutdown ≈ 130°C

PIN DESCRIPTION

PIN	NAME	FUNCTION	PIN	NAME	FUNCTION
1	V _{DD}	Digital supply voltage	9	V _{DD}	Digital supply voltage
2	PV _{DD1}	Voltage supply for internal power transistors	10	V_{FB}	Input for external compensation feedback
3	V_{L1}	Output voltage/ inductor connection	11	VREF _{IN}	Input for external reference voltage
4	P _{GND1}	Ground for output power transistors	12	SHDN	Shutdown active low. CMOS input
5	P _{GND2}	Ground for output power transistors			level
6	V_{L2}	Output voltage/inductor connection	13	AGND	Ground for internal reference voltage divider
7	PV _{DD2}	Voltage supply for internal power transistors	14	VREF _{OUT}	Reference voltage output
8	D _{GND}	Digital ground	15	V _{CCQ}	Voltage reference for internal voltage divider
			16	AV_{CC}	Analog voltage supply

ABSOLUTE MAXIMUM RATINGS

Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

PV _{DD}

Note 1: Limits are guaranteed by 100% testing, sampling, or correlation with worst-case test conditions.

Note 2: AV_{CC}, PV_{DD} = $3.3V \pm 10\%$

Note 3: Infinite heat sink

FUNCTIONAL DESCRIPTION

This switching regulator is capable of sinking and sourcing 3A of current without an external heatsink. The ML6554 uses a power surface mount package (PSOP) that includes an integrated heat slug. The heat can be piped through the bottom of the device and onto the PCB (Figure 2).

The ML6554 integrates two power MOSFETs that can be used to source and sink 3A of current while maintaining a tight voltage regulation. Using the external feedback, the output can be regulated well within 3% or less, depending on the external components chosen. Separate voltage supply inputs have been added to accommodate applications with various power supplies for the databus and power buses.

OUTPUTS

The output voltage pins (V_{L1} , V_{L2}) are tied to the databus, address, or clock lines via an external inductor. See the Applications section for recommendations. Output voltage is determined by the V_{CCQ} or $VREF_{IN}$ inputs.

INPUTS

The input voltage pins (V_{CCQ} or VREF_{IN}) determine the output voltages (V_{L1} or V_{L2}). In the default mode, where the VREF_{IN} pin is floating, the output voltage is 50% of the V_{CCQ} input. V_{CCQ} can be the reference voltage for the databus.

Output voltage can also be selected by forcing a voltage at the VREF_{IN} pin. In this case, the output voltage follows the voltage at the VREF_{IN} input. Simple voltage dividers can be used this case to produce a wide variety of output voltages between 2.3V to 4V.

VREF INPUT AND OUTPUT

The VREF_{IN} input can be used to force a voltage at the outputs (Inputs section, above). The VREF_{OUT} pin is an output pin that is driven by a small output buffer to provide the V_{REF} signal to other devices in the system. The output buffer is capable of driving several output loads. The output buffer can handle 3mA.

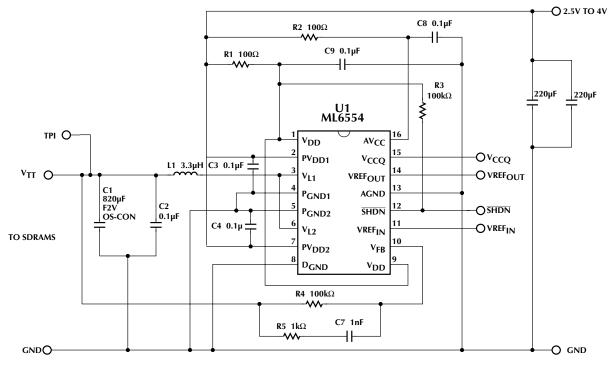

OTHER SUPPLY VOLTAGES

Several inputs are provide for the supply voltages: $\mathsf{PV}_{\mathsf{DD1}},$ $\mathsf{PV}_{\mathsf{DD2}},$ $\mathsf{AV}_{\mathsf{CC}},$ and $\mathsf{V}_{\mathsf{DD}}.$

The PV_{DD1} and PV_{DD2} and provide the power supply to the power MOSFETs. V_{DD} provides the voltage supply to the digital sections, while AV_{CC} supplies the voltage for the analog sections. Again, see the Applications section for recommendations.

FEEDBACK INPUT

The V_{FB} pin is an input that can be used for closed loop compensation. This input is derived from the voltage output. See application section for recommendation.

APPLICATIONS

USING THE ML6554 FOR SSTL BUS TERMINATION

The circuit schematic in Figure 1 shows a recommended approach for an constructing a bus terminating solution for an SSTL-2 bus. This circuit can be used in PC memory and Graphics memory applications as shown in Figures 3 and 4. Note that the ML6554 can provide the voltage reference (V_{REF}) and terminating voltages (V_{TT}). Using the layout as shown in Figures 5, 6, and 7, and measuring the V_{TT} performance using the test setup as described in Figure 8, the ML6554 delivered a $V_{TT} \pm 20mV$ for 1A to 3A loads (see Figure 9). Table 1 provides a recommended parts list. For more recent Applications Notes or Evaluation Boards contact Micro Linear.

POWER HANDLING CAPABILITY OF THE PSOP PACKAGE

Using the board layout shown in Figures 5,6, and 7; soldering the ML6554 to the board at zero LFPM the temperature around the package measured 55PC for 3A loads. Note that a 1ounce copper plane was used in the board construction.

Airflow is not likely to be needed in the operation of this device (assuming a board layout similar to that described above). The power handling performance of the PSOP package is shown by a study of the package manufacturer for various airflow vs. θ_{JA} conditions in Figure 10.

BUS TERMINATION SOLUTIONS FOR OTHER BUSES

Table 2 provides a summary of various bus termination V_{REF} & V_{TT} requirements. The ML6554 can be used for those applications.
