

3.3 VOLT 16M x 64 HIGH PERFORMANCE**133 MHZ SDRAM****UNBUFFERED SODIMM****Features**

- JEDEC-standard 144 pin, Small-Outline, Dual in line Memory Module (SODIMM)
- Serial Presence Detect with E²PROM
- Nonbuffered
- Fully Synchronous, All Signals Registered on Positive Edge of System Clock
- Single +3.3V (± 0.3V) Power Supply
- All Device Pins are LVTTTL Compatible
- 8192 Refresh Cycles every 64 ms
- Self-Refresh Mode
- Internal Pipelined Operation; Column Address can be changed every System Clock
- Auto Precharge and Piecharge all Banks by A10
- Data Mask Function by DQM
- Mode Register Set Programming
- Programmable (CAS Latency:2, 3 Clocks)

Description

The V436616Y24VATG-75 memory module is organized 16,777,216 x 64 bits in a 144 pin SODIMM. The 16M x 64 memory module uses 4 Mosel-Vitelic 16M x 16 SDRAM. The x64 modules are ideal for use in high performance computer systems where increased memory density and fast access times are required.

Serial Presence Detect Information

A serial presence detect storage device - E²PROM - is assembled onto the module. Information about the module configuration, speed, etc. is

written into the E²PROM device during module production using a serial presence detect protocol (I²C synchronous 2-wire bus)

Notes:

1. The specified values are valid when addresses are changed no more than once during $t_{CK}(\text{min.})$ and when No Operation commands are registered on every rising clock edge during $t_{RC}(\text{min.})$. Values are shown per module bank.
2. The specified values are valid when data inputs (DQ's) are stable during $t_{RC}(\text{min.})$.
3. All AC characteristics are shown for device level.
An initial pause of 100 μs is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
4. AC timing tests have $V_{IL} = 0.4\text{V}$ and $V_{IH} = 2.4\text{V}$ with the timing referenced to the 1.4V crossover point. The transition time is measured between V_{IH} and V_{IL} . All AC measurements assume $t_T = 1 \text{ ns}$ with the AC output load circuit shown. Specific t_{ac} and t_{oh} parameters are measured with a 50 pF only, without any resistive termination and with an input signal of 1V / ns edge rate between 0.8V and 2.0V.

5. If clock rising time is longer than 1 ns, a time $(t_T/2 - 0.5)$ ns has to be added to this parameter.
6. Rated at 1.5V
7. If t_T is longer than 1 ns, a time $(t_T - 1)$ ns has to be added to this parameter.
8. Any time that the refresh Period has been exceeded, a minimum of two Auto (CBR) Refresh commands must be given to “wake-up” the device.
9. Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to t_{RC} is satisfied once the Self Refresh Exit command is registered.
10. Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.
11. t_{DAL} is equivalent to $t_{DPL} + t_{RP}$.
