- Notes:**
1. This calculation accounts for  $t_{DQSQ(max)}$ , the pulse width distortion of on-chip circuit and jitter.
  2. Data sampled at the rising edges of the clock : A0~A11, BA0~BA1, CKE, CS, RAS, CAS, WE.
  3. For command/address input slew rate  $\geq 1.0V/ns$
  4. For command/address input slew rate  $\geq 0.5V/ns$  and  $< 1.0V/ns$
  5. CK, CK slew rates are  $\geq 1.0V/ns$
  6. These parameters guarantee device timing, but they are not necessarily tested on each device, and they may be guaranteed by design or tester correlation.
  7. Data latched at both rising and falling edges of Data Strokes(DQS) : DQ, DM
  8. Minimum of 200 cycles of stable input clocks after Self Refresh Exit command, where CKE is held high, is required to complete Self Refresh Exit and lock the internal DLL circuit of DDR SDRAM.
