

The RF Line UHF Power Amplifiers

Capable of wide power range control as encountered in portable cellular radio applications (30 dB typical).

- MHW803-2 806–870 MHz
- Specified 7.5 Volt Characteristics
 - RF Input Power = 1 mW (0 dBm)
 - RF Output Power = 2 Watts
 - Minimum Gain ($V_{Control} = 4 V$) = 33 dB
 - Harmonics = -45 dBc Max @ $2 f_o$
- 50 Ω Input/Output Impedance
- Guaranteed Stability and Ruggedness
- Epoxy Glass PCB Construction Gives Consistent Performance and Reliability
- Circuit board photomaster available upon request by contacting RF Tactical Marketing in Phoenix, AZ.

APPLICATIONS INFORMATION

NOMINAL OPERATION

All electrical specifications are based on the nominal conditions of $V_{S1} = V_{S2} = V_{S3} = 7.5$ Vdc (Pins 2, 3, 4) and P_{Out} equal to 2 watts. With these conditions, maximum current density on any device is 1.5×10^5 A/cm² and maximum die temperature with 100°C case operating temperature is 165°C. While the modules are designed to have excess gain margin with ruggedness, operation of these units outside the limits of published specifications is not recommended unless prior communications regarding intended use have been made with the factory representative.

GAIN CONTROL

The module output should be limited to 2 watts. The preferred method of power output control is to fix $V_{S1} = V_{S2} = V_{S3} = 7.5$ Vdc (Pins 2, 3, 4), P_{in} (Pin 1) at 1 mW, and vary V_{Cont} (Pin 1) voltage.

DECOUPLING

Due to the high gain of the three stages and the module size limitation, external decoupling networks require careful consideration. Pins 2, 3 and 4 are internally bypassed with a 0.018 μ F chip capacitor which is effective for frequencies from 5 MHz through 905 MHz. For bypassing frequencies below 5 MHz, networks equivalent to that shown in Figure 1 are recommended. Inadequate decoupling will result in spurious outputs at certain operating frequencies and certain phase angles of input and output VSWR.

LOAD MISMATCH

During final test, each module is load mismatch tested in a fixture having the identical decoupling networks described in Figure 1. Electrical conditions are $V_{S1} = V_{S2} = V_{S3}$ equal to 10 Vdc, VSWR equal to 10:1, and output power equal to 3 watts.
