**Medium Power Surface Mount Products**  
**TMOS Single P-Channel**  
**Field Effect Transistors**

MiniMOS™ devices are an advanced series of power MOSFETs which utilize Motorola's High Cell Density HDTMOS process. These miniature surface mount MOSFETs feature ultra low  $R_{DS(on)}$  and true logic level performance. They are capable of withstanding high energy in the avalanche and commutation modes and the drain-to-source diode has a very low reverse recovery time. MiniMOS devices are designed for use in low voltage, high speed switching applications where power efficiency is important. Typical applications are dc-dc converters, and power management in portable and battery powered products such as computers, printers, cellular and cordless phones. They can also be used for low voltage motor controls in mass storage products such as disk drives and tape drives. The avalanche energy is specified to eliminate the guesswork in designs where inductive loads are switched and offer additional safety margin against unexpected voltage transients.

- Ultra Low  $R_{DS(on)}$  Provides Higher Efficiency and Extends Battery Life
- Logic Level Gate Drive — Can Be Driven by Logic ICs
- Miniature SO-8 Surface Mount Package — Saves Board Space
- Diode Is Characterized for Use In Bridge Circuits
- Diode Exhibits High Speed, With Soft Recovery
- $I_{DSS}$  Specified at Elevated Temperature
- Avalanche Energy Specified
- Mounting Information for SO-8 Package Provided

**MMSF3205**

Motorola Preferred Device

**SINGLE TMOS  
POWER MOSFET  
11 AMPERES  
20 VOLTS  
 $R_{DS(on)} = 0.015 \text{ OHM}$**

**CASE 751-06, Style 12  
SO-8**

**DEVICE MARKING**

**ORDERING INFORMATION**

Device	Reel Size	Tape Width	Quantity
S3205	13"	12 mm embossed tape	4000 units

## MMSF3205

### MAXIMUM RATINGS ( $T_J = 25^\circ\text{C}$ unless otherwise noted)

Negative sign for P-Channel devices omitted for clarity

Rating		Symbol	Max	Unit
Drain-to-Source Voltage		$V_{DSS}$	20	V
Drain-to-Gate Voltage ( $R_{GS} = 1.0\text{ M}\Omega$ )		$V_{DGR}$	20	V
Gate-to-Source Voltage — Continuous		$V_{GS}$	$\pm 12$	V
1 inch SQ. FR-4 or G-10 PCB  10 seconds	Thermal Resistance — Junction to Ambient	$R_{THJA}$	50	$^\circ\text{C/W}$
	Total Power Dissipation @ $T_A = 25^\circ\text{C}$	$P_D$	2.5	Watts
	Linear Derating Factor		20	$\text{mW}/^\circ\text{C}$
	Drain Current — Continuous @ $T_A = 25^\circ\text{C}$	$I_D$	11	A
	Continuous @ $T_A = 70^\circ\text{C}$	$I_D$	8.0	A
	Pulsed Drain Current (1)	$I_{DM}$	55	A
Minimum FR-4 or G-10 PCB  10 seconds	Thermal Resistance — Junction to Ambient	$R_{THJA}$	80	$^\circ\text{C/W}$
	Total Power Dissipation @ $T_A = 25^\circ\text{C}$	$P_D$	1.56	Watts
	Linear Derating Factor		12.5	$\text{mW}/^\circ\text{C}$
	Drain Current — Continuous @ $T_A = 25^\circ\text{C}$	$I_D$	8.6	A
	Continuous @ $T_A = 70^\circ\text{C}$	$I_D$	6.4	A
	Pulsed Drain Current (1)	$I_{DM}$	43	A
Operating and Storage Temperature Range		$T_J, T_{stg}$	- 55 to 150	$^\circ\text{C}$
Single Pulse Drain-to-Source Avalanche Energy — Starting $T_J = 25^\circ\text{C}$ ( $V_{DD} = 20\text{ Vdc}$ , $V_{GS} = 4.5\text{ Vdc}$ , Peak $I_L = 11\text{ Apk}$ , $L = \text{TBD mH}$ , $R_G = 25\ \Omega$ )		$E_{AS}$	TBD	mJ

(1) Repetitive rating; pulse width limited by maximum junction temperature.

**ELECTRICAL CHARACTERISTICS** ( $T_C = 25^\circ\text{C}$  unless otherwise noted)

Characteristic	Symbol	Min	Typ	Max	Unit
----------------	--------	-----	-----	-----	------

**OFF CHARACTERISTICS**

Drain-to-Source Breakdown Voltage ( $V_{GS} = 0\text{ Vdc}$ , $I_D = 0.25\text{ mAdc}$ ) Temperature Coefficient (Positive)	$V_{(BR)DSS}$	20 —	— TBD	— —	Vdc mV/ $^\circ\text{C}$
Zero Gate Voltage Drain Current ( $V_{DS} = 20\text{ Vdc}$ , $V_{GS} = 0\text{ Vdc}$ ) ( $V_{DS} = 20\text{ Vdc}$ , $V_{GS} = 0\text{ Vdc}$ , $T_J = 70^\circ\text{C}$ )	$I_{DSS}$	— —	— —	1.0 5.0	$\mu\text{Adc}$
Gate-Body Leakage Current ( $V_{GS} = \pm 12\text{ Vdc}$ , $V_{DS} = 0$ )	$I_{GSS}$	—	—	100	nAdc

**ON CHARACTERISTICS(1)**

Gate Threshold Voltage ( $V_{DS} = V_{GS}$ , $I_D = 0.25\text{ mAdc}$ ) Threshold Temperature Coefficient (Negative)	$V_{GS(th)}$	0.6 —	— —	— —	Vdc mV/ $^\circ\text{C}$
Static Drain-to-Source On-Resistance ( $V_{GS} = 4.5\text{ Vdc}$ , $I_D = 11\text{ Adc}$ ) ( $V_{GS} = 2.5\text{ Vdc}$ , $I_D = 8.6\text{ Adc}$ )	$R_{DS(on)}$	— —	TBD TBD	15 25	$\text{m}\Omega$
On-State Drain Current ( $V_{DS} \leq 5.0\text{ V}$ , $V_{GS} = 4.5\text{ V}$ )	$I_{D(on)}$	20	—	—	A
Forward Transconductance ( $V_{DS} = 10\text{ Vdc}$ , $I_D = 11\text{ Adc}$ )	$g_{FS}$	40	TBD	—	Mhos

**DYNAMIC CHARACTERISTICS**

Input Capacitance	$(V_{DS} = 16\text{ Vdc}$ , $V_{GS} = 0\text{ Vdc}$ , $f = 1.0\text{ MHz}$ )	$C_{iss}$	—	TBD	TBD	$\text{pF}$
Output Capacitance		$C_{oss}$	—	TBD	TBD	
Transfer Capacitance		$C_{rss}$	—	TBD	TBD	

**SWITCHING CHARACTERISTICS(2)**

Turn-On Delay Time	$(V_{DD} = 10\text{ Vdc}$ , $I_D = 1.0\text{ Adc}$ , $V_{GS} = 4.5\text{ Vdc}$ , $R_G = 6.0\ \Omega$ ) (1)	$t_{d(on)}$	—	TBD	TBD	ns
Rise Time		$t_r$	—	TBD	TBD	
Turn-Off Delay Time		$t_{d(off)}$	—	TBD	TBD	
Fall Time		$t_f$	—	TBD	TBD	
Gate Charge See Figure 8	$(V_{DS} = 10\text{ Vdc}$ , $I_D = 11\text{ Adc}$ , $V_{GS} = 4.5\text{ Vdc}$ ) (1)	$Q_T$	—	TBD	TBD	nC
		$Q_1$	—	TBD	—	
		$Q_2$	—	TBD	—	
		$Q_3$	—	TBD	—	

**SOURCE-DRAIN DIODE CHARACTERISTICS**

Forward On-Voltage(1)	$(I_S = 2.1\text{ Adc}$ , $V_{GS} = 0\text{ Vdc}$ ) (1) $(I_S = 2.1\text{ Adc}$ , $V_{GS} = 0\text{ Vdc}$ , $T_J = 125^\circ\text{C}$ )	$V_{SD}$	— —	TBD TBD	1.2 —	Vdc
Reverse Recovery Time See Figure 15	$(I_S = 2.1\text{ Adc}$ , $V_{GS} = 0\text{ Vdc}$ , $dI_S/dt = 100\text{ A}/\mu\text{s}$ ) (1)	$t_{rr}$	—	TBD	TBD	ns
		$t_a$	—	TBD	—	
		$t_b$	—	TBD	—	
Reverse Recovery Stored Charge		$Q_{RR}$	—	TBD	—	$\mu\text{C}$

(1) Pulse Test: Pulse Width  $\leq 300\ \mu\text{s}$ , Duty Cycle  $\leq 2\%$ .

(2) Switching characteristics are independent of operating junction temperature.

(3) Reflects typical values.  $C_{pk} = \left| \frac{\text{Max limit} - \text{Typ}}{3 \times \text{SIGMA}} \right|$ 

(4) Repetitive rating; pulse width limited by maximum junction temperature.

## INFORMATION FOR USING THE SO-8 SURFACE MOUNT PACKAGE

### MINIMUM RECOMMENDED FOOTPRINT FOR SURFACE MOUNTED APPLICATIONS

Surface mount board layout is a critical portion of the total design. The footprint for the semiconductor packages must be the correct size to ensure proper solder connection interface

between the board and the package. With the correct pad geometry, the packages will self-align when subjected to a solder reflow process.

### SO-8 POWER DISSIPATION

The power dissipation of the SO-8 is a function of the input pad size. This can vary from the minimum pad size for soldering to the pad size given for maximum power dissipation. Power dissipation for a surface mount device is determined by  $T_{J(max)}$ , the maximum rated junction temperature of the die,  $R_{\theta JA}$ , the thermal resistance from the device junction to ambient; and the operating temperature,  $T_A$ . Using the values provided on the data sheet for the SO-8 package,  $P_D$  can be calculated as follows:

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

The values for the equation are found in the maximum ratings table on the data sheet. Substituting these values into

the equation for an ambient temperature  $T_A$  of 25°C, one can calculate the power dissipation of the device which in this case is 1.6 Watts.

$$P_D = \frac{150^\circ\text{C} - 25^\circ\text{C}}{80^\circ\text{C/W}} = 1.6 \text{ Watts}$$

The 80°C/W for the SO-8 package assumes the recommended footprint on a glass epoxy printed circuit board to achieve a power dissipation of 1.6 Watts using the footprint shown. Another alternative would be to use a ceramic substrate or an aluminum core board such as Thermal Clad™. Using board material such as Thermal Clad, the power dissipation can be doubled using the same footprint.

### SOLDERING PRECAUTIONS

The melting temperature of solder is higher than the rated temperature of the device. When the entire device is heated to a high temperature, failure to complete soldering within a short time could result in device failure. Therefore, the following items should always be observed in order to minimize the thermal stress to which the devices are subjected.

- Always preheat the device.
- The delta temperature between the preheat and soldering should be 100°C or less.\*
- When preheating and soldering, the temperature of the leads and the case must not exceed the maximum temperature ratings as shown on the data sheet. When using infrared heating with the reflow soldering method, the difference shall be a maximum of 10°C.

- The soldering temperature and time shall not exceed 260°C for more than 10 seconds.
- When shifting from preheating to soldering, the maximum temperature gradient shall be 5°C or less.
- After soldering has been completed, the device should be allowed to cool naturally for at least three minutes. Gradual cooling should be used as the use of forced cooling will increase the temperature gradient and result in latent failure due to mechanical stress.
- Mechanical stress or shock should not be applied during cooling.

\* Soldering a device without preheating can cause excessive thermal shock and stress which can result in damage to the device.

**TYPICAL SOLDER HEATING PROFILE**

For any given circuit board, there will be a group of control settings that will give the desired heat pattern. The operator must set temperatures for several heating zones and a figure for belt speed. Taken together, these control settings make up a heating "profile" for that particular circuit board. On machines controlled by a computer, the computer remembers these profiles from one operating session to the next. Figure 1 shows a typical heating profile for use when soldering a surface mount device to a printed circuit board. This profile will vary among soldering systems, but it is a good starting point. Factors that can affect the profile include the type of soldering system in use, density and types of components on the board, type of solder used, and the type of board or substrate material being used. This profile shows temperature versus time. The

line on the graph shows the actual temperature that might be experienced on the surface of a test board at or near a central solder joint. The two profiles are based on a high density and a low density board. The Vitronics SMD310 convection/infrared reflow soldering system was used to generate this profile. The type of solder used was 62/36/2 Tin Lead Silver with a melting point between 177–189°C. When this type of furnace is used for solder reflow work, the circuit boards and solder joints tend to heat first. The components on the board are then heated by conduction. The circuit board, because it has a large surface area, absorbs the thermal energy more efficiently, then distributes this energy to the components. Because of this effect, the main body of a component may be up to 30 degrees cooler than the adjacent solder joints.
