# **Quad Latch**

The MC10153 is a high speed, low power, MECL quad latch consisting of four bistable latch circuits with D type inputs and gated Q outputs. Open emitters allow a large number of outputs to be wire-ORed together. Latch outputs are gated, allowing direct wiring to a bus. When the clock is low, outputs will follow D inputs. Information is latched on positive going transition of the clock. The MC10153 provides the same logic function as the MC10133, except for inversion of the clock.

 $P_D = 310 \text{ mW typ/pkg (No Load)}$  $t_{Dd} = 4.0 \text{ ns typ}$ 

 $t_r$ ,  $t_f = 2.0$  ns typ (20%–80%)

### DIP PIN ASSIGNMENT

Pin assignment is for Dual-in-Line Package. For PLCC pin assignment, see the Pin Conversion Tables on page 6–11 of the Motorola MECL Data Book (DL122/D).

<sup>†</sup> Output level to be measured after a clock pulse has been applied to the clock input (Pin 4) VIHmax VILmin

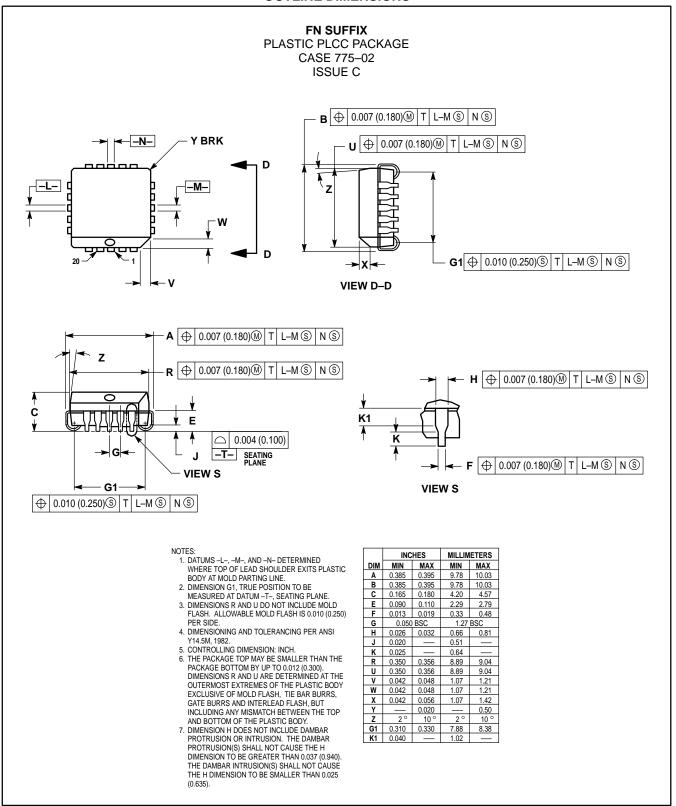

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50–ohm resistor to –2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.

MOTOROLA 3–54

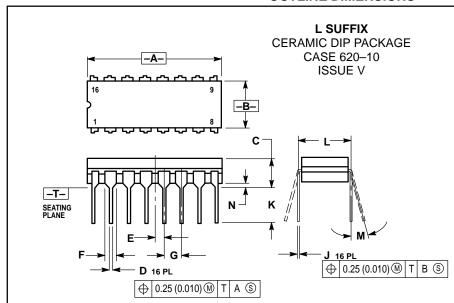

<sup>‡</sup> Data input at proper high/low level while clock pulse is high so that device latches ar proper high/low level for test. Levels are measured after device has latched.

<sup>\*</sup> Latch set to zero state before test.
