

M.S.KENNEDY CORP.

**DUAL HIGH VOLTAGE/
HIGH CURRENT
OPERATIONAL AMPLIFIER**

182/183

4707 Dey Road Liverpool, N.Y. 13088

(315) 701-6751

FEATURES:

- Space Efficient Dual Amplifier
- High Voltage Operation:
 - Single Supply: +8V to +60V
 - Dual Supply: ±4V to ±30V
- High Output Current: 3 Amp Continuous per amplifier
- High Speed: 10V/μS
- Low Quiescent Current: 20 mA per amplifier Typ.
- Adjustable Current Limits
- Thermal Shutdown
- Monolithic Technology
- Enable/Status Pin For Output Disable Control

MIL-PRF-38534 CERTIFIED

MSK182

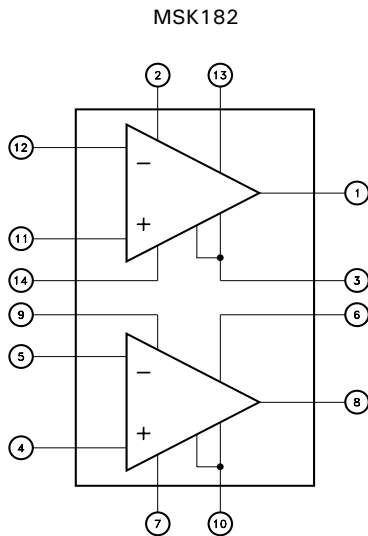

MSK183

DESCRIPTION:

The MSK 182 and 183 are dual high power monolithic operational amplifiers ideal for use with a wide variety of loads. With operation from either single or dual supplies, they offer excellent design flexibility. Power dissipation is kept to a minimum with a quiescent current rating of only 20mA per amplifier, while 3 Amps of continuous available output current makes the MSK 182 or MSK 183 a very good low cost choice for motor drive circuits and audio amplification. The design is internally protected against current overloads and overtemperature conditions. Current limit can also be user-selected through the use of a resistor/potentiometer or voltage out/current out DAC. The MSK 182 is packaged in a hermetically sealed 14 pin power DIP with bolt down tabs for applications that require heat sinking. The MSK 183 is packaged in a low cost ceramic SIP.

EQUIVALENT SCHEMATIC

TYPICAL APPLICATIONS

- Servo Driver
- Actuator Driver
- Audio Amplifier
- Power Supplies
- Bridge Amps
- Stereo Amps

NOTES:

- ① Unless otherwise specified $\pm V_{CC} = \pm 30V_{DC}$ and E/S pin is open.
- ② All electrical specifications apply to each amplifier.
- ③ Devices shall be capable of meeting the parameter, but need not to be tested. Typical parameters are for reference only.
- ④ Industrial grade and 'E' suffix devices shall be tested to subgroups 1 and 4 unless otherwise specified.
- ⑤ Military grade devices ('H' suffix) shall be 100% tested to subgroups 1,2,3 and 4.
- ⑥ Subgroup 1,4 $T_A = T_C = +25^\circ C$
 Subgroup 2 $T_A = T_C = +125^\circ C$
 Subgroup 3 $T_A = T_C = -55^\circ C$

APPLICATION NOTES

POWER SUPPLIES:

For the MSK 182/183 maximum total supply voltage is specified as 60V. However, dual and unbalanced power supply operation is permissible as long as total supply voltage does not exceed 60V.

POWER SUPPLY BYPASSING:

Power supply terminals must be effectively decoupled with a high and low frequency bypass circuit to avoid power supply induced oscillation. An effective decoupling scheme consists of a 0.1 μ F ceramic capacitor in parallel with a 10 μ F tantalum capacitor for each power supply pin to ground. In addition, it is recommended that a 0.01 μ F capacitor be placed between $\pm V_{cc}$ as close to the MSK 182 as possible.

CURRENT LIMIT:

The MSK 182 and MSK 183 offer accurate, user-selectable current limit. Unlike typical designs that use a power resistor in series with the output to sense load, the MSK 182 and MSK 183 sense the load indirectly and therefore do not require a resistor to handle the full output current. Current limit is selected by controlling the input to the I_{LIM} pin.

The easiest method is to use a resistor or potentiometer connected between $-V_{cc}$ and the I_{LIM} pin. Use the following equation to select proper resistor value:

$$R_{cc} = \frac{71,250}{I_{LIM}} - 13.75K\Omega$$

A low level control signal (0-330 μ A) can also be used to control the current level digitally. If the pin is left open, the current is programmed to OA, while connecting I_{LIM} directly to $-V_{cc}$ sets the output current to its maximum, typically 5A.

SAFE OPERATING AREA:

The safe operating area curve is a graphical representation of the power handling capability of the amplifier under various conditions. Power dissipation of the device is equal to the product of the voltage across the output transistor times the output current. As can be seen in the curve, safe operating current decreases with an increase in temperature as well as an increase in the voltage across the output transistor. Therefore, for maximum amplifier performance it is important to keep case temperature as low as possible and to keep $\pm V_{cc}$ as close to the output rail as achievable.

THERMAL PROTECTION:

The MSK 182 and MSK 183 are equipped with thermal protection circuitry that protects each amplifier from damage caused by excessive junction temperature. The output is disabled when the junction temperature reaches approximately 160°C. After the junction temperature cools to approximately 140°C, the output is again enabled. The thermal protection may cycle on and off depending on the output load and signal conditions; this may have an undesirable effect on the load.

It should be noted that even though this internal protection circuitry does protect against overload conditions, it does not take the place of proper heat sinking. For reliable operation, junction temperature should be limited to 150°C, maximum.

ENABLE/STATUS PIN:

This pin actually has a dual function. First, when the pin is forced low, the output stage is disabled. Second, it can be monitored to determine if the device is in thermal shutdown. These functions can be used on the same device with either single or dual supplies. For normal operation, the E/S pin must be left open or pulled at least 2.4 volts above the negative rail. In noisy applications, a small value capacitor between the E/S pin and $-V_{cc}$ may be required.

To disable the output, the user must pull the E/S pin low, no greater than 0.8V above $-V_{cc}$. To once again enable the device, the E/S pin must be brought at least 2.4 volts above $-V_{cc}$ or be disconnected. It should be noted that when the E/S pin is high, the internal thermal shutdown is still active.

If the E/S pin is used to monitor thermal shutdown, during normal operation the voltage on the E/S pin is typically 3.5V above $-V_{cc}$. Once shutdown has occurred this voltage will drop to approximately 350mV above $-V_{cc}$.

COMPENSATION:

For normal operation output compensation is not typically required. However, if the MSK 182 or MSK 183 is intended to be driven into current limit the user may find that an R/C network is required. A snubber network from the output to ground for each amplifier will provide stability. If driving large capacitive or inductive loads, a snubber network will also enhance stability. Typically 3 Ω to 10 Ω in series with 0.01 μ F is acceptable.

NOTE: (1) I_{LIM} connected to V_- achieves the maximum current limit, 5A(peak). (2) Connect capacitors directly to package power supply pins.

TYPICAL CONNECTION DIAGRAM

APPLICATION NOTES cont.

RESISTOR METHOD

$$R_{CL} = \frac{15000 (4.75V)}{I_{LIM}} - 13750\Omega$$

DAC METHOD (Current or voltage)

$$I_{SET} = I_{LIM} / 15000$$

$$V_{SET} = (V-) + 4.75V - (13750\Omega)(I_{LIM}) / 15000$$

DESIRED CURRENT LIMIT	RESISTOR(1) (R _{CL})	CURRENT (I _{SET})	VOLTAGE (V _{SET})
0A	I _{LIM} Open	0uA	(V-)+4.75V
1A	57.6KΩ	67uA	(V-)+3.8V
2.5A	14.7KΩ	167uA	(V-)+2.5V
3A	10KΩ	200uA	(V-)+2V
4A	4.02KΩ	267uA	(V-)+1.1V
5A	I _{LIM} Connected to V-	333uA	(V-)

NOTE: (1) Resistors are nearest standard 1% values.

Figure 1 Adjustable Current Limit

Figure 3 Thermal Shutdown Status With a Single Supply

Figure 3 Thermal Shutdown Status With a Single Supply

For Example:
 If $I_{LIM} = 3A$, $R_{CL} = 10K\Omega$
 $V_{CL} = \frac{10K\Omega \cdot 4.75V}{(10K\Omega + 13750\Omega)} = 2V$
 Desired $V_o = 20V$, $G = \frac{20}{2} = 10$
 $R1 = 1K\Omega$ and $R2 = 9K\Omega$

Figure 5 Voltage Source

Uses voltage developed at I_{LIM} pin as a moderately accurate reference voltage.
