

# MX•CDM, INC. MiXed Signal ICs **DATA BULLETIN MX613**

# **Global Call Progress Detector**

### PRELIMINARY INFORMATION

- MX• COM MiXed Signal CMOS
- Covers Worldwide Call Progress Frequencies (300Hz TO 2150Hz)
- Decode Single or Modulated Tones

- Analog In / Serial Data Out
- µProcessor Compatible Outputs
- Speech Discrimination Ability
- Low Power Operation

The MX613 is a wide-band, 'N-Tone' non-predictive tone decoder that measures telephone system call progress tones in PABX, Pay/Feature-Phone, Fax and Modem systems.

Adhering to Must/Must-Not Decode limits and able to measure inband frequencies in outband modulation, this decoder measures the frequency of input signals in the range 300 to 2,150Hz. The result of each measurement is presented to a system uProcessor as a 6-bit serial word.

The decode frequency range, which covers the world's call progress application spectrum, is processed internally as two bands: LO = 300 to 660Hz and HI = 900 to 2150Hz. Frequency measurement is achieved by counting the number of cycles in a set time period

(LO = 39.47ms or HI = 13.16ms). Bad signal/level quality or Notone results in a count-abort, timing-reset and no output from the decoder.

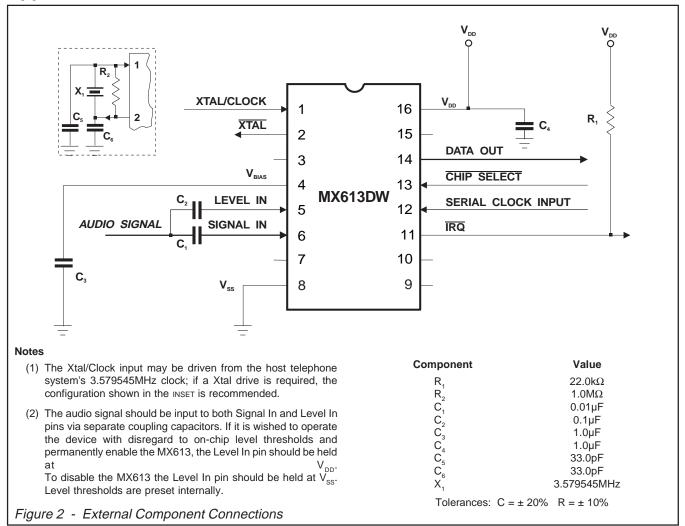

Front-end filtering is achieved using our patented Auto-Correlator. Current frequency information is output for the μProcessor using a Serial Data, Clock and Interrupt interface.

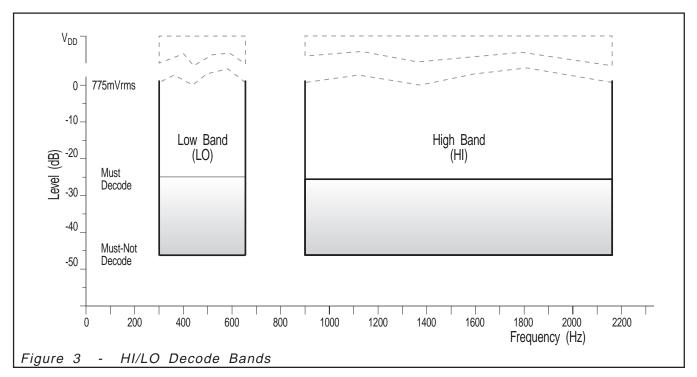

Data from the MX613 should be processed by a µProcessor whose algorithms are able to recognize the frequency, sequence and/or cadence of input signals as national call progress information; e.g.: 'Dial,' 'Busy,' 'Number-Unobtainable,' 'Ringing' and automatic tones used by fax and modem systems. Software can be simply configured to reject speech frequencies.

Available in SOIC and PDIP packages, this low-cost, mixed signal IC has a typical power requirement of less than 1mA at 3 volts and utilizes a telecom-system clock input of 3.579545MHz to maintain frequency accuracy.

| Pin Number |        | Function  |  |  |  |  |  |  |  |
|------------|--------|---|--|--|--|--|--|--|--|
| MX613DW    | MX613P |   |  |  |  |  |  |  |  |
| 1          | 1      | <b>Xtal/Clock</b> : The input to the on-chip clock oscillator inverter. A 3.579545MHz Xtal or externally derived telephone system clock (f <sub>XTAL</sub> ) should be connected here. Operation of the MX613 without a suitable Xtal/Clock input may cause device damage.  |  |  |  |  |  |  |  |
| 2          | 2      | Xtal: The output of the on-chip clock oscillator inverter. See Figure 2.  |  |  |  |  |  |  |  |
| 3          | 3      | No internal connection.   |  |  |  |  |  |  |  |
| 4          | 4      | $V_{\text{BIAS}}$ : The internal circuitry bias line, held at $V_{\text{DD}}/2$ this pin must be decoupled to $V_{\text{SS}}$ .   |  |  |  |  |  |  |  |
| 5          | 5      | <b>Level In:</b> The input for level discrimination. This input is internally biased to $V_{BIAS}$ . Signals must be a.c. coupled, and the audio signal must be fed to both this pin and the Signal In pin. Correct level detection determines the operation of this device (see Principles of Decoder Operation). But if you wish to disregard the amplitude of the input levels, the MX613 may be permanently enabled by pulling this pin to $V_{DD}$ and disabled by pulling to $V_{SS}$ . |  |  |  |  |  |  |  |
| 6          | 6      | <b>Signal In:</b> The input for frequency discrimination and decoding. This input is internally biased to $V_{\text{BIAS}}$ . Signals must be a.c. coupled. The audio signal must be fed to both this pin and the Level In pin.   |  |  |  |  |  |  |  |
| 7          |        | No internal connection.   |  |  |  |  |  |  |  |
| 8          | 7      | V <sub>ss</sub> : Signal ground (GND).  |  |  |  |  |  |  |  |
| 9          | 8      | No internal connection.   |  |  |  |  |  |  |  |
| 10         |        | No internal connection.   |  |  |  |  |  |  |  |
| 11         | 9      | IRQ: This Interrupt Request output from the MX613 is 'wire-OR able' allowing the interrupt outputs of other peripherals to be combined and connected to the Interrupt input of aμProcessor. This input has a low-impedance pulldown to V <sub>ss</sub> when active and a high-impedance when inactive. An interrupt is produced on completion of a HI or LO frequency measurement.  |  |  |  |  |  |  |  |
| 12         | 10     | <b>Serial Clock:</b> The serial clock from the μProcessor. Data Out is clocked into the μProcessor on the rising edge of the Serial Clock. See Data-Read Timing diagram.  |  |  |  |  |  |  |  |
| 13         | 11     | Chip Select: A logic "0" at this input will select this device.   |  |  |  |  |  |  |  |
| 14         | 12     | <b>Data Out:</b> The serial data output. Under the control of the Chip Select and Serial Clock inputs, data should be read from this output in 6-bit blocks MSB (Bit-5) first. If 8 serial clock pulses are applied, two additional logic "0s" will be output after Bit-0.  |  |  |  |  |  |  |  |
| 15         | 13     | No internal connection.   |  |  |  |  |  |  |  |
| 16         | 14     | $ m V_{pp}$ : Positive supply input. A single, stable supply is required. Levels and voltages within the MX613 are dependent upon this supply. This pin should be decoupled to $\rm V_{ss}$ by a capacitor located close to the MX613 pins.   |  |  |  |  |  |  |  |

# **Application Information**

# Application Information .....

## **Principles of Decoder Operation**

### **Level Detection**

Because level and frequency discrimination operations take place in parallel, the audio signal should, under normal circumstances, be input to both Signal In and Level In pins via coupling capacitors.

If the input signal level (Level In) is outside the preset 'Must/Must Not Decode' thresholds (see Specifications), the Universal Call Progress Decoder will be disabled.

If it is wished to disregard signal input *levels* at the Level In pin and attempt to decode under all conditions, the decoder may be permanently enabled by holding the Level In pin at  $V_{\rm pp}$ .

The MX613 can disabled by pulling Level In to V<sub>ss</sub>.

### **Notione Recognition**

The **N**otone condition can be recognized using µProcessor software timing as below.

- a. Set the  $\mu P$  timer period to a period greater than the relevant frequency-band measurement period (13.16ms or 39.47ms).
- b. Each 'Tone Measurement Complete' interrupt from the MX613 must reset the μP timer.
- c. With NOTONE or white noise at the decoder input, the MX613 on-chip timer will be continually reset.
  - i. 'Tone Measurement Complete' interrupt will not occur the μP timer will run.
  - ii. The  $\mu P$  Timer time-out can be considered as a **Notone** indication.

| Level In        | Timer         | IRQ              | Data Out |                                      |
|-----------------|---------------|------------------|----------|--------------------------------------|
| In Limits       | Running       | Enabled          | Enabled  |                                      |
| Out of Limits   | Reset         | Disabled         | Disabled | (frozen to previous bit-5 level      |
| V <sub>DD</sub> | Running/Reset | Enabled/Disabled | Enabled  | (dependent upon Quality measurement) |
| V <sub>ss</sub> | Reset         | Disabled         | Disabled | (frozen to previous bit-5 level)     |

### **Frequency Band Discrimination**

The input signal is amplified by a self-biased (zero-crossing) inverting amplifier and then 'filtered' to remove high-frequency noise and jitter.

High (HI) and Low (LO) counters are employed to determine the input frequency band (HI = 900Hz to 2150Hz, LO = 300Hz to 660Hz).

If the input frequency is in the LO Band, the device will operate as a LO Band decoder and will remain so until a HI frequency signal is detected. If the input frequency is in the HI Band, the device will operate as a HI Band decoder and will remain so until a LO frequency signal is detected.

Frequency band monitoring is continuous with the band selection taking place every 9.8ms. It will therefore take 9.8ms from Power-Up to set up the initial correct decode frequency band.

### **On-Chip Timer Operation**

For frequency measurement, the MX613 counts the number of input cycles in a fixed time period. This fixed period, measured by the continuous on-chip timer, is set to 13.16ms for HI Band inputs and 39.47ms for LO Band inputs.

When the timer expires the following actions take place:

- a. A HI or LO ("1" or "0") band indication bit is latched into Bit-5 of the Serial Output Port.
- b. The Frequency Counter count of 5-bits is latched into the Serial Output Port (Bit-4 [MSB] to Bit-0). The Serial Output Port Contains 6-bits, if 8 Serial Clock edges are employed, two extra "0s", which should be ignored, will be output last.
- c. An interrupt is generated (IRQ) to the  $\mu$ Processor. The contents of the Serial Output Port should be read before the next interrupt is expected; if not data will be overwritten.

When the Chip Select input is set to "0" the interrupt is reset.

The On-Chip Timer and Frequency Counter will be reset in mid-count, and therefore unable to allow a valid measurement, under the following conditions:

- a. A change of decode frequency band.
- b. Decoder disabled; signal input level out of specification or Level Detect input set to V<sub>ss</sub>.
- c. Signal Quality Assessment considered 'Bad'.
- d. Input signal frequency outside limits.

# **Application Information .....**

N = int (Frequency x Measurement Period)

Measurement Period = 39.47ms for Low Band (300Hz to 660Hz) = 13.16ms for High Band (900Hz to 2150Hz)

Note: For input frequencies of between 661Hz and 899Hz the MX613 will give no reliable output.

When a 'correct' decode has been allowed and an interrupt generated, a 6-bit data word is presented at the Serial Output Port. This 6-bit word indicates the input frequency's band (Bit 5) and value 'N' as indicated below.

| Bit 5<br>Outpu | Band Bit (5)  | MSB (4) | (3)                   | (2)                 | (1)                   | LSB (0) | Bits<br>0 to 4 |
|----------------|---------------|---------|-----------------------|---------------------|-----------------------|---------|----------------|
| First          | HI-"1"/LO-"0" | Bit     | s 0 to 4 represent th | ne measured frequer | ncy in the selected b | and     | = N            |

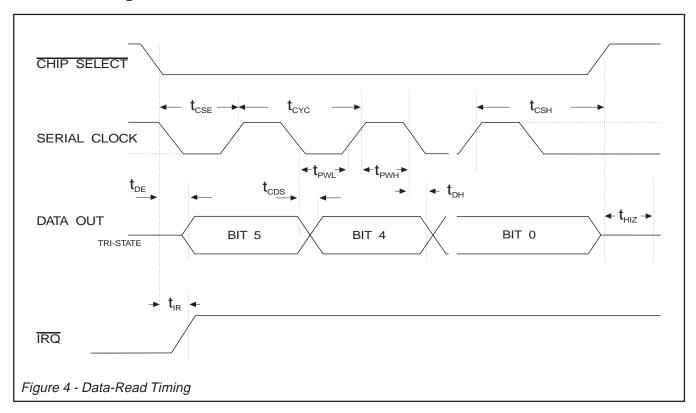

When a 'correct' decode has been allowed and an interrupt generated, a 6-bit data word will be presented at the Serial Output Port. This 6-bit word indicates the input frequency's band and value as described below.

As an example, the following binary-word presented at the Serial Output Port (1 1 0 1 1 0) will indicate a frequency in the HI Band of between 1680Hz and 1740Hz (Bit-5 = "1" = HI, 'N' = 22).

| LO Band     | HI Band     | N     | B <sub>5</sub> | B <sub>4</sub> | B <sub>3</sub> | B <sub>2</sub> | B <sub>1</sub> | B <sub>o</sub> | LO Band    | HI Band | N    | B <sub>5</sub> | B <sub>4</sub> | $B_3$ | B <sub>2</sub> | B <sub>1</sub> | B <sub>o</sub> |
|-------------|-------------|-------|----------------|----------------|----------------|----------------|----------------|----------------|------------|---------|------|----------------|----------------|-------|----------------|----------------|----------------|
| 280         | 840         | 11    | H/L            | 0              | 1              | 0              | 1              | 1              | 505        | 1515    | 19   | H/L            | 1              | 0     | 0              | 1              | 1              |
| 285         | 855         | 11    |                |                |                |                |                |                | 510        | 1530    | 20   | H/L            | 1              | 0     | 1              | 0              | 0              |
| 290         | 870         | 11    |                |                |                |                |                |                | 515        | 1545    | 20   |                |                |       |                |                |                |
| 295         | 885         | 11    |                |                |                |                |                |                | 520        | 1560    | 20   |                |                |       |                |                |                |

### **Notes**

- 1 Data is output bit 5 first. Bit 5 can be clocked into the μProcessor by the first Serial Clock rising edge. If 8 Serial Clock pulses are employed the last 2 data-bits will be "0" and should be ignored by the software.
- 2 Chip Select should be used to react to Interrupts and then returned to a logic "1". If Chip Select stays low there will be no further Interrupts and no Data Output update.

# **Specifications**

## **Absolute Maximum Ratings**

Exceeding the maximum rating can result in device damage. Operation of the device outside the operating limits is not suggested.

Supply Voltage -0.3 to 7.0V Input Voltage at any pin (ref V<sub>ss</sub>=0V) -0.3 to  $(V_{DD} + 0.3V)$ Sink/Source Current (supply pins) ± 30mA ±20mA (other pins) **Total Device Dissipation**  $(@T_{AMB}=25^{\circ}C)$ 800mW max. Derating 10 mW/°C -40°C to +85°C Operating Temperature Storage Temperature -55°C to +125°C

## **Operating Limits**

All devices were measured under the following conditions unless otherwise noted.

$$V_{DD} = 3.3V$$

$$T_{OP} = 25^{\circ}C$$

Audio Level 0dB ref = 775 mVrms

 $Xtal/Clock f_0 = 3.579545 MHz$

#### **Notes**

- 1. Into a high-impedance load (>1.0M $\Omega$ ).
- 2. Must decode signal above -25.2dB; Must Not decode signal below -46.0dB. If a supply other than 3.3 volts is used, levels will change pro-rata.
- 3. Under 'Pure Tone' input conditions.
- 4. For input frequencies of between 661Hz and 899Hz the MX613 will provide no reliable output.
- 5. With an amplitude modulating frequency of between 16.0Hz and 100Hz.
- 6. Test noise input = 5.0kHz at 100mVrms
