

NT512S72V4PA0GR
512MB : 64M x 72
Registered SDRAM Module

64Mx72 bit One Bank Registered SDRAM Module
 based on 64Mx4, 4Banks, 8K Refresh, 3.3V Synchronous DRAMs with SPD

Features

- JEDEC-standard 168-pin, dual in-line memory module (DIMM)
- PC133- and PC100-compliant
- Registered inputs with one-clock delay
- Phase-lock loop (PLL) clock driver to reduce loading
- ECC-optimized pinout
- Inputs and outputs are LVTTTL (3.3V) compatible
- Single 3.3V ± 0.3V Power Supply
- Fully synchronous to positive edge
- Suspend Mode and Power Down Mode
- Auto Refresh (CBR) and Self Refresh
- Automatic and controlled Precharge commands
- SDRAMs have 4 internal banks (64Mx4 SDRAM)
- Module has 1 physical bank 512MB (64 Meg x 72)
- 8192 Refresh cycles distributed across 64ms

- DIMM $\overline{\text{CAS}}$ latency * (Registered mode) :

Speed grade	Frequency	$\overline{\text{CAS}}$ latency
-7K	133MHz	3
-75B	133MHz	4
-8B	100MHz	3

* DIMM $\overline{\text{CAS}}$ latency = device CL + 1 for registered mode.

- Programmable Operation:
 - Burst Type: Sequential or Interleave
 - Burst Length: 1, 2, 4, and 8
 - Operation: Burst Read and Write or Multiple Burst Read with Single Write
- Gold contacts
- SDRAMs in TSOP Type II Package
- Serial Presence Detect (SPD) with Write Protect

Description

The NANYA NT512S72V4PA0GR is a registered 168-Pin Synchronous DRAM Dual In-Line Memory Module (DIMM) organized as a 64Mx72 high-speed memory array. The DIMM uses eighteen 64Mx4 SDRAMs in 400 mil TSOP packages. The DIMM achieves high-speed data-transfer rates of 100MHz and 133MHz by employing a prefetch/pipeline hybrid architecture that synchronizes the output data to a system clock.

The DIMM is intended for use in applications operating at 100MHz and 133MHz memory bus speeds. All control and address signals are re-driven through registers/buffers to the SDRAM devices. Operating in registered mode (REGE pin tied high), the control/address input signals are latched in the register on one rising clock edge and sent to the SDRAM devices on the following rising clock edge (data access is delayed by one clock).

A phase-lock loop (PLL) on the DIMM is used to re-drive the clock signals to both the SDRAM devices and the registers to minimize system clock loading. (CK0 is connected to the PLL, and CK1, CK2, and CK3 are terminated on the DIMM). A single clock enable (CKE0) controls all devices on the DIMM, enabling the use of SDRAM Power Down modes.

Prior to any access operation, the device $\overline{\text{CAS}}$ latency and burst type/length/operation type must be programmed into the DIMM by address inputs A0-A12 and I/O addresses BA0 and BA1 using the mode register set cycle. The DIMM $\overline{\text{CAS}}$ latency when operated in Registered mode is one clock later than the device $\overline{\text{CAS}}$ latency due to the address and control signals being clocked to the SDRAM devices.

The DIMM uses serial presence detects implemented via a serial EEPROM using the two-pin IIC protocol. The first 128 bytes of serial PD data are programmed and locked by the DIMM manufacturer. The last 128 bytes are available to the customer and may be write protected by providing a high level to pin 81 on the DIMM. An on-board pull-down resistor keeps this in the Write Enable mode.

All NANYA 168-pin DIMMs provide a high-performance, flexible 8-byte interface in a 5.25" long space-saving footprint.

Ordering Information

Block Diagram (1 Bank, 64Mx4 SDRAMs)

Notes : 1. All resistor values are 10 ohms unless otherwise specified.

Input/Output Functional Description

Symbol	Type	Polarity	Function
CK0 - CK3	Input	Positive Edge	The system clock inputs. All of the SDRAM inputs are sampled on the rising edge of their associated clock. CK0 drives the PLL. CK1, CK2 and CK3 are terminated.
CKE0	Input	Active High	Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, Suspend mode, or the Self Refresh mode.
$\overline{S0}$, $\overline{S2}$	Input	Active Low	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue.
\overline{RAS} , \overline{CAS} , \overline{WE}	Input	Active Low	When sampled at the positive rising edge of the clock, \overline{RAS} , \overline{CAS} , \overline{WE} define the operation to be executed by the SDRAM.
BA0, BA1	Input	-	Selects which SDRAM bank is to be active.
A0 - A9 A10/AP A11, A12	Input	-	During a Bank Activate command cycle, A0-A12 defines the row address (RA0-RA12) when sampled at the rising clock edge. During a Read or Write command cycle, A0-A9, A11 defines the column address (CA0-CA9,A11) when sampled at the rising clock edge. In addition to the column address, AP is used to invoke Autoprecharge operation at the end of the Burst Read or Write cycle. If AP is high, autoprecharge is selected and BA0/BA1 define the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0/BA1 to control which bank(s) to precharge. If AP is high all 4 banks will be precharged regardless of the state of BA0/BA1. If AP is low, then BA0/BA1 are used to define which bank to pre-charge.
DQ0 - DQ63, CB0 - CB7	Input /Output	-	Data and Check Bit input/output pins .
DQMB0 -DQMB7	Input	Active High	The Data Input/Output masks, associated with one data byte, place the DQ buffers in a high impedance state when sampled high. In Read mode, DQMB has a latency of three clock cycles in Registered mode, and controls the output buffers like an output enable. In Write mode, DQMB has a latency of one clock cycle in Registered mode. In this case, DQMB operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high.
REGE	Input	Active High (Register Mode Enable)	The Register Enable pin must be held high for proper registered mode operation (signals re-driven to the SDRAMs when the clock rises, and held valid until the next rising clock).
SA0 – SA2	Input	-	Address inputs. Connected to either VDD or VSS on the system board to configure the Serial Presence Detect EEPROM address.
SDA	Input /Output	-	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus time to VDD to act as a pull up.
SCL	Input	-	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to VDD to act as a pull up.
WP	Input	Active High	This signal is pulled low on the DIMM to enable data to be written into the last 128 bytes of the SPD EEPROM.
VDD , VSS	Supply		Power and ground for the module.

Absolute Maximum Ratings

Symbol	Parameter	Rating	Units	Notes
V _{DD}	Power Supply Voltage	-0.3 to +4.6	V	1
V _{IN}	Input Voltage	-1.0 to 4.6		
V _{OUT}	Output Voltage	-1.0 to 4.6		
T _A	Operating Temperature (ambient)	0 to +70	°C	1
T _{STG}	Storage Temperature	-55 to +125	°C	1
P _D	Power Dissipation	10.3	W	1,2
I _{OUT}	Short Circuit Output Current	50	mA	1

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.

This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

2. Maximum power is calculated assuming the DIMM is Auto Refresh mode.

Recommended DC Operating Conditions (T_A=0 to 70 °C)

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
V _{DD}	Power Voltage	3.0	3.3	3.6	V	1
V _{IH}	Input High Voltage	2.0	-	V _{DD} + 0.3	V	1,2
V _{IL}	Input Low Voltage	-0.3	-	0.8	V	1,3
V _{OH}	Output High Voltage	2.4	-	-	V	
V _{OL}	Output Low Voltage	-	-	0.4	V	
I _{IL}	Input Leakage current	-10	-	10	uA	

1. All voltages referenced to V_{SS}.

2. V_{IH} (max) = V_{DD} / V_{DDQ} + 1.2V for pulse width ≤ 5ns

3. V_{IL} (min) = V_{SS} / V_{SSQ} - 1.2V for pulse width ≤ 5ns.

Capacitance (T_A=25 °C, f =1MHz, V_{DD}=3.3 ± 0.3V)

Symbol	Parameter	Max.	Unit
C _{I1}	Input Capacitance (A0-A9, A10/AP, A11, A12, BA0, BA1, CKE0, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$)	19	pF
C _{I2}	Input Capacitance ($\overline{\text{S0}}$ - $\overline{\text{S2}}$)	15	
C _{I3}	Input Capacitance (DQMB0 - DQMB7)	14	
C _{I4}	Input Capacitance (REGE)	10	
C _{I5}	Input Capacitance (CK0)	28	
C _{I6}	Input Capacitance (CK1, CK2, CK3)	24	
C _{I7}	Input Capacitance (SA0 - SA2, SCL, WP)	9	
C _{I01}	Input/Output Capacitance (DQ0 - DQ63, CB0 - CB7)	13	
C _{I02}	Input/Output Capacitance (SDA)	11	

DC Output Load Circuit

Operating, Standby, and Refresh Currents (TA = 0 to 70 °C, VDD = 3.3 ± 0.3V)

Parameter	Symbol	Test condition	Speed			Unit	Note
			- 7K	- 75B	- 8B		
Operating current	I _{CC1}	1 bank operation, t _{RC} = t _{RC} (min), t _{CK} = min Active-Precharge Command cycling without burst operation	2600	2400	2300	mA	1
Precharge standby current in power-down mode	I _{CC2P}	CKE0 ≤ V _{IL} (max), t _{CK} = min, S0, S2 = V _{IH} (min)	276	276	276	mA	1
	I _{CC2PS}	CKE0 ≤ V _{IL} (max), t _{CK} = ∞, S0, S2 = V _{IH} (min)	51	51	51	mA	
Precharge standby current in non power-down mode	I _{CC2N}	CKE0 ≥ V _{IH} (min), t _{CK} = min S0, S2 = V _{IH} (min)	780	780	520	mA	
	I _{CC2NS}	CKE0 ≥ V _{IH} (min), t _{CK} = ∞, S0, S2 = V _{IH} (min)	123	123	123	mA	
No Operating current (Active state : 4 bank)	I _{CC3P}	CKE0 ≤ V _{IL} (max), t _{CK} = min. S0, S2 = V _{IH} (min) (Power Down Mode)	348	348	348	mA	
	I _{CC3N}	CKE0 ≥ V _{IH} (min), t _{CK} = min S0, S2 = V _{IH} (min)	1320	1320	990	mA	1
Operating current (Burst mode)	I _{CC4}	t _{CK} = min, Read/ Write command cycling, Multiple banks active, gapless data, BL=4	2400	2400	1800	mA	1,2
Auto(CBR) refresh current	I _{CC5}	t _{CK} = min, CBR command cycling	2850	2850	2520	mA	1
Self refresh current	I _{CC6}	CKE0 ≤ 0.2V	69	69	69	mA	

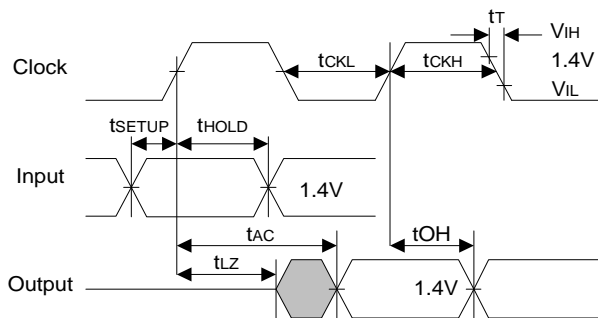

1. These parameters depend on the cycle rate and are measured with the cycle determined by the minimum value of t_{CK} and t_{RC}. Input signals are changed once during t_{CK} (min). t_{CK} (min) = 7.5ns.

2. The specified values are obtained with the DIMM data outputs open.

AC Characteristics ($T_A = 0$ to 70 °C , $V_{DD} = 3.3 \pm 0.3V$)

1. An initial pause of 200ms, with CKE0 held high, is required after power-up. A Precharge All Banks command must be given followed by a minimum of eight Auto (CBR) Refresh cycles before or after the Mode Register Set operation.
2. AC timing tests have $V_{IL} = 0.8V$ and $V_{IH} = 2.0V$ with the timing referenced to the 1.40V crossover point.
3. The Transition time is measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}).
4. AC measurements assume $t_T = 1.2ns$ (1 Volt/ns rise time).
5. In addition to meeting the transition rate specification, the clock and CKE must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
6. A 1ms stabilization time is required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal.
7. All timings are specified at the input receiver of the signal. This allows times to be specified at the end of a transmission line versus at the DIMM connector which may display significant reflections. Refer to the device specifications for non-skew adjusted timings.

AC Output Load Circuits

AC Timing Parameters *

(*Module AC timing parameters comply with PC100 and PC133 Design Specs, based on component parameters.)

Clock and Clock Enable Parameters

Symbol	Parameter	- 7K		- 75B		- 8B		Unit	Note
		Min.	Max.	Min.	Max.	Min.	Max.		
tCK3	Clock Cycle Time, $\overline{\text{CAS}}$ Latency = 3	7	1000	7.5	1000	8	1000	ns	
tCK2	Clock Cycle Time, $\overline{\text{CAS}}$ Latency = 2	7.5	1000	10	1000	10	1000	ns	
tAC3(B)	Clock Access Time, $\overline{\text{CAS}}$ Latency = 3	-	5.4	-	5.4	-	6	ns	1
tAC2(B)	Clock Access Time, $\overline{\text{CAS}}$ Latency = 2	-	5.4	-	6	-	6	ns	1
tCKH	Clock High Pulse Width	2.5	-	2.5	-	3	-	ns	2
tCKL	Clock Low Pulse Width	2.5	-	2.5	-	3	-	ns	2
tCES	Clock Enable Set-up Time	1.5	-	1.5	-	2	-	ns	
tCEH	Clock Enable Hold Time	0.8	-	0.8	-	1	-	ns	
tSB	Power down mode Entry Time	0	7.5	0	7.5	0	12	ns	
tT	Transition Time (Rise and Fall)	0.5	10	0.5	10	0.5	10	ns	

1. Access time is measured at 1.4V. In AC Characteristics section, see notes.
2. tCKH is the pulse width of CLK measured from the positive edge to the negative edge referenced to V_{IH} (min). tCKL is the pulse width of CLK measured from the negative edge to the positive edge referenced to V_{IL} (max).

Common Parameters

34	Data Input Setup Time Before Clock	1.5ns	1.5ns	2ns	15	15	20	
35	Data Input Hold Time After Clock	0.8ns	0.8ns	1ns	08	08	10	
36-61	Reserved	Undefined			00			
62	SPD Revision	1.2A	1.2A	1.2A	12	12	12	
63	Checksum for byte 0 - 62	Checksum Data			75	BB	02	

Serial Presence Detect -- Part 2 of 2

64Mx72 SDRAM Registered DIMM based on 64Mx4, 4Banks, 8K Refresh, 3.3v SDRAMs with SPD

Byte	Description	SPD Entry Value			Serial PD Data Entry (Hexadecimal)			Note
		-7K	-75B	-8B	-7K	-75B	-8B	
64-71	Manufacturer's JEDED ID Code	0B hex.			7F7F7F0B00000000			3
72	Module Manufacturing Location	N/A			00			
73-90	Module Part number	N/A	N/A	N/A	00	00	00	
91-92	Module Revision Code	N/A			00			
93-94	Module Manufacturing Data	Year/Week Code			yy/ww			1,2
95-98	Module Serial Number	Serial Number			00			
99-125	Reserved	Undefined			00			
126	Modules Supports this Clock Frequency	100MHz			64			
127	Attributes for Clock Frequency defined in byte 126				F5	F5	FF	
128-255	Open for customer Use	Undefined			00			

1. yy= Binary coded decimal year code, 0-99(Decimal), 00-63(Hex)
2. ww= Binary coded decimal year code, 01-52(Decimal), 01-34(Hex)
3. NANYA 11decimal (bank four) 0000 1011 binary 0B Hex.

Package Dimensions

Note : All dimensions are typical unless otherwise stated.

Unit : Millimeters
Inches
