

BIPOLAR ANALOG INTEGRATED CIRCUIT $\mu PC1857A$

SOUND CONTROL IC WITH SURROUND AND I2C BUS

DESCRIPTION

The μ PC1857A is a sound control IC with I²C bus.

It has functions to control volume, balance, and tone, and a phase shift matrix surround function.

The surround function achieves wide sound expansion using only two front speakers. Three modes can be selected: movie mode that increases the presence of sound with stereo sound input, music mode emphasizing vocal music, and simulated mode that gives expansion and left and right sound depth with monaural sound input.

The μ PC1857A can perform all control (mode switching, volume control and so on) using l²C.

FEATURES

- Volume control function
- : Attenuation adjustable from 0 to -80 dB in 64 steps
- Balance control function : The difference in attenuation adjustable from 0 to -80 dB in 64 steps
- Tone (bass, treble) control function : Adjustable in 32 steps from +10 to -10 dB
- · Surround function (gain adjustable) : Three modes (movie, music, and simulated)
- Mute function
- Mixing function
- · Output selection function (for two mono channels input)
- All parameters can be controlled via I²C bus.

APPLICATIONS

• TV, PC monitor

Table 1-1. Pin Function List (7/7)

Remark Pin voltage is the reference value when Vcc = 12 V.

2. ATTENTIONS

(1) Attention on Pop Noise Reduction

When changing the surround mode, use the mute function (approx. 200 ms) for pop noise reduction (see **4.4.1 Mute**).

When turning ON/OFF power to the μ PC1857A, use the external mute function for pop noise reduction.

(2) Attention on Supply Voltage

Drive data on the I²C bus after supply voltage of total application system becomes stable.

3. I²C BUS INTERFACE

The μ PC1857A has serial bus function.

This serial bus (I²C bus) is a double-wired bus developed by Philips. It is composed of 2 wires: serial clock line (SCL) and serial data line (SDA).

The μ PC1857A has built-in I²C bus interface circuit, and five rewritable registers (8 bits).

SCL (Serial Clock Line)

The host CPU outputs a serial clock to synchronize with the data. The μ PC1857A takes in the serial data based on this clock.

Input level is compatible with CMOS.

Clock frequency is 0 to 100 kHz.

SDA (Serial Data Line)

The host CPU outputs the data which is synchronized with the serial clock. The μ PC1857A takes in this data based on the clock.

Input level is compatible with CMOS.

Figure 3-1. Internal Equivalent Circuit of Interface Pin

3.1 Data Transfer

3.1.1 Start condition

Start condition is made by SDA falling from "High" to "Low" while SCL is "High" as shown in Figure 3-2. When this start condition is received, the μ PC1857A takes in the data synchronized with the serial clock after that.

3.1.2 Stop condition

Stop condition is made by SDA rising from "Low" to "High" while SCL is "High" as shown in Figure 3-2. When this stop condition is received, the μ PC1857A stops taking in or outputting data.

Figure 3-2. Start/Stop Condition of Data Transfer

3.1.3 Data transfer

When transferring data, the data must be changed while SCL is "Low" as shown in Figure 3-3. Never change the data while SCL is "High".

Notes 1. Data hold time for l^2C device: 300 ns MIN., Data hold time for CPU: 5 μ s MIN. **2.** Data setup time: 250 ns MIN.

Remark Clock frequency: 0 to 100 kHz

3.2 Data Transfer Format

Figure 3-4 shows an example of data transfer in write mode.

Figure 3-4. Example of Data Transfer in Write Mode

Remark W: Write mode, ACK: Acknowledge bit

Data is composed of 8 bits. One acknowledge bit always follows these 8 bits of data. Data must be transferred starting from the MSB.

The 1 byte immediately following the start condition specifies a slave address (chip address). This slave address is composed of 7 bits.

Table 3-1 shows the slave address of the μ PC1857A. This slave address is registered by Philips.

Table 3-1.	Slave	Address	of	$\mu \mathbf{P}$	C1857/	4
------------	-------	---------	----	------------------	--------	---

		Slave Address						
Blas Voltage of ADS (Pin 22)	D6	D5	D4	D3	D2	D1 ^{Note}	D0	
5 V	1	0	0	0	1	1	0	
GND	1	0	0	0	1	0	0	

Note The user can set bit D1 freely.

- 0: Bias voltage of ADS (pin 22) is 0 V.
- 1: Bias voltage of ADS (pin 22) is 5 V.

The 1 bit following the slave address is a read/write bit which specifies the direction of the data to be subsequently transferred. Write "0" to this read/write bit because the μ PC1857A is write mode only.

The byte following the slave address is the subaddress byte of the μ PC1857A.

The μ PC1857A has five subaddresses, from SA₀ to SA₄, and each of these addresses is composed of 8 bits. The data to be set to a subaddress follows this subaddress byte.

3.2.1 1-byte data transfer

The format in which 1-byte data is to be transferred is as follows:

Start Slave address Write mode ACK Subaddress ACK Data ACK	Stop
--	------

3.2.2 Successive data transfer

The μ PC1857A has an automatic increment function which can be used to transfer successive data (refer to **4.4.6** Automatic increment).

By using this function, the internal subaddress is automatically incremented if a slave address and a subaddress have been set, so that the data from subsequent subaddresses can be transferred in succession.

Incrementing the subaddress of the μ PC1857A is stopped when the subaddress reaches "04H".

The format in which 5 bytes of data are to be transferred in succession by using the automatic increment function is as follows:

Start	Slave address	Write mode	ACK	Subaddress	ACK	Data 1	ACK	Data 2	ACK		Data 5	ACK	Stop
))			

The host CPU transfers "00H" as subaddress SA₀ after start and slave addresses, as shown above. Data SA₀ is transferred after this subaddress SA₀, and without transferring the stop condition the data SA₁, SA₂, SA₃, and SA₄ are transferred successively, and then the stop condition is transferred.

To successively change data at a fixed subaddress, for example to turn up/down the volume, turn off the automatic increment function.

3.2.3 Acknowledge

On the I²C bus, an acknowledge bit is appended to the 9th bit following the data. This acknowledge bit is used to judge whether data transfer has been successful. The host CPU judges whether data transfer has been successful or not, depending on whether the status of the acknowledge bit is "H" or "L".

When the acknowledge bit is "L", it indicates success. When the acknowledge bit is "H", it indicates failure of transfer or forced release of bus (NAK status). The NAK status occurs when a wrong slave address is transferred to a slave IC or data transfer from slave side is finished in the read status.

4. EXPLANATION OF EACH COMMAND

4.1 Subaddress List

Bit	MSB	D6		D5		D4	Г)3	D2	,		D1		LSB
Subaddress	D7	20		20		DŢ		<i>,</i> 0						D0
00H	Output mute	0		Outp	ut sele	ct	;	Surround	1 mode			Surro	ound effe	ect
	0: OFF		D5	D4	Lout	Rout	D3	D2	Мо	ode	D	1 [D0	Gain
	1: ON		0	0	L	R	0	0	Simu	lated	C)	0	0 dB
			0	1	L	L	0	1	Mu	isic	C)	1	–3 dB
			1	0	R	R	1	0	Мо	vie	1	I	0	–6 dB
			1	1	L + R	L+R	1	1	O	FF	1	I	1	–12 dB
01H	Mix	Automatic				Volume	e level							
	0: OFF	increment				Volume	э:	MAX	to	M	IN			
	1: ON	0: OFF				Data	:	11111	1 to	000	000			
		1: ON												
02H	0	Automatic				Balanc	е							
		increment				L volun	ne :	MIN	to	MA	٩X	to	MAX	
		0: OFF				R volur	ne:	MAX	to	MA	٩X	to	MIN	
		1: ON				Data	:	11111	1 to	100	000	to	000000	J
03H	0	Automatic	Γ	0		Bass lev	/el							
		increment				Gain	:	Boost	to	0		to	Cut	
		0: OFF				Data	:	11111	to	1000	00	to	00000	
		1: ON												
04H	0	Automatic		0		Treble le	evel							
		increment				Gain	:	Boost	to	0		to	Cut	
		0: OFF				Data	:	11111	to	1000	00	to	00000	
		1: ON												

- Cautions 1. Be sure to write "0" to bit D7 of subaddresses 02H through 04H, bit D6 of subaddress 00H, and bit D5 of subaddresses 03H and 04H.
 - 2. The surround mode is OFF: 00H (D3, D2 = 11) in any mode other than stereo mode is selected for output: 00H (D5, D4 = 00).

4.2 Initialization

After power application, be sure to initialize the subaddresses as shown below.

Table 4-1. Initialization of μ PC1857A (recommendation value	Table 4-1.	Initialization of	μPC1857A	(recommendation	value)
--	------------	-------------------	----------	-----------------	--------

Bit Subaddress	MSB D7	D6	D5	D4	D3	D2	D1	LSB D0
00H	0	0	0	0	1	1	0	0
01H	0	_	_	_	_	_	_	_
02H	0	_	1	0	0	0	0	0
03H	0	_	0	1	0	0	0	0
04H	0	-	0	1	0	0	0	0

Caution Until initialization is completed, mute using an external unit.

Remark -: Don't care.

4.3 Surround Function

For how to set the surround mode, refer to the table below.

Table 4-2. Setting Surround Mode

Setting	Subaddı	ress: 00H	De	escription
Surround Mode	D3	D2	Units of Phase Shifter	Effect
Simulated	0	0	4 units	Monaural to pseudo-stereo
Music	0	1	1 unit	Stereo sound to surround
Movie	1	0	4 units	
OFF	1	1	-	Through

Caution When changing the surround mode, use the mute function (approx. 200 ms) for pop noise reduction.

4.4 Explanation of Each Command

4.4.1 Mute

The mute function can be turned ON/OFF by using data of bit D7 of subaddress 00H.

Caution When changing the surround mode, and when turning ON/OFF power, use the mute function (approx. 200 ms) for pop noise reduction.

4.4.2 Output selection

Output can be selected by using data of bits D5 and D4 of subaddress 00H.

Figure 4-2. Output Selection

Caution The surround mode is OFF (D3, D2 = 11) in modes other than the stereo mode (D5, D4 = 00).

4.4.3 Surround mode

The following surround modes can be selected by using data of bits D3 and D2 of subaddress 00H.

- Simulated : Simulated stereo sound for monaural source. The difference between the signal that has gone through HPF and the signal that has gone through LPF is calculated, and the phase of the difference is shifted and added to the original signal. The simulated stereo effect is created if the output frequency characteristics of the L-channel and R-channel signals is comb-shaped.
- Music : Surround sound for stereo source. The phase of the differential signal between L and R channels (L-R signal) is rotated by a phase shifter (1-unit), and is added to the original signal.
- Movie : Surround sound for stereo source. The phase of the differential signal between L and R channels (L-R signal) is rotated by a phase shifter (4-unit), and is added to the original signal.
- OFF : Original signal as is.

Figure 4-3. Surround Mode

Caution The surround mode is OFF (D3, D2 = 11) if the stereo mode is not selected by the output selection bits (D5, D4 = 00).

4.4.4 Surround effect

The surround effect can be changed in four steps by using the data of bits D1 and D0 of subaddress 00H.

Figure 4-4. Surround Effect

4.4.5 Mix

Mixing of the signal input to the MIX pin can be turned ON/OFF by using the data of bit D7 of subaddress 01H.

4.4.6 Automatic increment

The automatic increment function can be turned ON/OFF by using the data of bit D6 of subaddresses 01H through 04H.

This is effective when transmitting data successively (refer to 3.2.2 Successive data transfer).

Figure 4-6. Automatic Increment

Caution Subaddress 00H does not have an automatic increment function. It is always set to ON.

The automatic increment function automatically increments the subaddress when data is transferred successively.

Automatic increment ON :	The subaddress is automatically incremented immediately after byte data with $D6 = 1$
	has been transferred.
	This setting is useful if the data at every subaddress is to be set at once for
	initialization. The subaddress is always incremented immediately after the data of
	subaddress: 00H has been transferred.
Automatic increment OFF :	The subaddress is fixed immediately after byte data with D6 = 0 has been
	transferred. This setting is useful when the data at the same subaddress is to be
	successively changed, for example to turn up/down the volume.

There is an automatic increment function ON/OFF bit in subaddresses 01H through 04H. Incrementing subaddresses is individually controlled by the automatic increment function ON/OFF bit of each subaddress.

For example, if the automatic increment function of subaddress 01H is turned ON, and that of subaddress 02H is turned OFF, the subaddress is automatically incremented from 01H to 02H, and is fixed to 02H.

Even if the automatic increment function ON/OFF bit of subaddress 04H is set to ON, the subaddress is not incremented. If the next data is transferred after the data of 04H has been set (acknowledge bit: L), acknowledge enters the NAK status (acknowledge bit: H), and data transfer from the host CPU is stopped.

4.4.7 Volume level

The volume of output can be controlled in 64 steps by using the data of bits D5 through D0 of subaddress 01H.

4.4.8 Balance

The balance of output of the Lout and Rout pins can be controlled in 64 steps by using the data of bits D5 through D0 of subaddress 02H.

4.4.9 Bass level

The bass level of output can be controlled in 32 steps by using the data of bits D4 through D0 of subaddress 03H.

Figure 4-9. Bass Level

4.4.10 Treble level

The treble level of output can be controlled in 32 steps by using the data of bits D4 through D0 of subaddress 04H.

Figure 4-10. Treble Level

5. ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings (Unless otherwise specified, T_A = 25 °C)

Parameter	Symbol	Condition	Rating	Unit
Supply voltage	Vcc	Without signal	14.0	V
Input signal voltage	Vin	Pins Lin, Rin, MIX	Vcc	V
I ² C bus input signal voltage	VCNT	Pins SDA, SCL	Vcc + 0.2	V
Permissible package dissipation	PD	T _A = 75 °C	500	mW
Operating temperature	TA	Vcc = 12 V	-20 to +75	°C
Storage temperature	Tstg		-40 to +125	°C

Caution If any of the parameters exceeds the absolute maximum ratings, even momentarily, the quality of the product may be impaired. The absolute maximum ratings are values that may physically damage the product(s). Be sure to use the product(s) within the ratings.

Recommended Operating Conditions (Unless otherwise specified, T_A = 25 °C)

7. PACKAGE DRAWING

30 PIN PLASTIC SHRINK DIP (400 mil)

NOTES

- 1. Controlling dimension millimeter.
- 2. Each lead centerline is located within 0.17 mm (0.007 inch) of its true position (T.P.) at maximum material condition.
- 3. Item "K" to center of leads when formed parallel.

8. RECOMMENDED SOLDERING CONDITIONS

It is recommended to solder this product under the conditions described below.

For details of the recommended soldering conditions, refer to the **Semiconductor Device Mounting Technology**

Manual (C10535E).

For soldering methods and conditions other than those recommended, consult NEC.

Soldering condition of through-hole type

µPC1857ACT: 30-pin plastic shrink DIP (400 mil)

Soldering Method	Soldering Condition					
Wave soldering (only pins)	Soldering bath temperature: 260 °C MAX., Time: 10 seconds					
Partial heating	Pin temperature: 300 °C MAX., Time: 3 seconds MAX. (per pin)					

Caution Apply wave soldering only to the pins, and exercise care that solder does not directly contact the package.

[MEMO]

[MEMO]

[MEMO]

Purchase of NEC I²C components conveys a license under the Philips I²C Patent Rights to use these components in an I²C system, provided that the system conforms to the I²C Standard Specification as defined by Philips.

EEPROM is a trademark of NEC Corp.

The application circuits and their parameters are for reference only and are not intended for use in actual design-ins.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

- Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
- Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
- Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
