

μ PD75104, 75106, 75108**4-BIT SINGLE-CHIP MICROCOMPUTER****DESCRIPTION**

μ PD75108 is a 4-bit single-chip microcomputer integrating timer/event counters, serial interface, and vector interrupt function, in addition to a CPU, ROM, RAM, and I/O ports, on a single chip. Operating at high speeds, the microcomputer allows data to be manipulated in units of 1, 4, or 8 bits. In addition, various bit manipulation instructions are provided to reinforce I/O manipulation capability. Equipped with I/Os for interfacing with peripheral circuits operating on a different supply voltage, outputs that can directly drive LEDs, and analog inputs, μ PD75108 is suitable for controlling such systems as VTRs, acoustic products, button telephones, radio communications equipment, and printers. A pin-compatible EPROM model is also available for evaluation of system development and small-scale production of application systems.

Detailed functions are described in the following user's manual. Be sure to read it for designing.
 μ PD751XX Series User's Manual: IEM-922

FEATURES

- Internal memory
 - Program memory (ROM)
 - : 8068 \times 8 bits (μ PD75108)
 - : 6016 \times 8 bits (μ PD75106)
 - : 4096 \times 8 bits (μ PD75104)
 - Data memory (RAM)
 - : 512 \times 4 bits (μ PD75108)
 - : 320 \times 4 bits (μ PD75106, 75104)
- New architecture "75X series" rivaling 8-bit microcomputers
- 43 systematically organized instructions
 - A wealth of bit manipulation instructions
 - 8-bit data transfer, compare, operation, increment, and decrement instructions
 - 1-byte relative branch instructions
 - GETI instruction executing 2-/3-byte instruction with one byte
- High speed. Minimum instruction execution time: 0.95 μ s (at 4.19 MHz), 5 V
- Power-saving, instruction time change function: 0.95 μ s/1.91 μ s/15.3 μ s (at 4.19 MHz)
- I/O port pins as many as 58
- Three channels of 8-bit timers
- 8-bit serial interface
- Multiplexed vector interrupt function
- Model with PROM is available: μ PD75P108B (One-time PROM, EPROM)

Unless there are differences among μ PD75104, 75106, and 75108 functions, μ PD75108 is treated as the representative model throughout this manual.

The information in this document is subject to change without notice.

ORDERING INFORMATION

Part Number	Package	Quality Grade
μPD75104CW-xxx	64-pin plastic shrink DIP (750 mil)	Standard
μPD75104GF-xxx-3BE	64-pin plastic QFP (14 × 20 mm)	Standard
μPD75106CW-xxx	64-pin plastic shrink DIP (750 mil)	Standard
μPD75106GF-xxx-3BE	64-pin plastic QFP (14 × 20 mm)	Standard
μPD75108CW-xxx	64-pin plastic shrink DIP (750 mil)	Standard
μPD75108GF-xxx-3BE	64-pin plastic QFP (14 × 20 mm)	Standard

Remarks: xxx is ROM code number.

Please refer to "Quality Grade on NEC Semiconductor Devices" (Document Number IEI-1209) published by NEC Corporation to know the specification of quality grade on the devices and its recommended applications.

FUNCTIONAL OUTLINE

Item		Specifications
Number of Basic Instructions		43
Minimum Instruction Execution Time		Changeable in three steps: 0.95 μs, 1.91 μs, and 15.3 μs at 4.19 MHz
Internal Memory	ROM	8064 × 8 bits (μPD75108), 6016 × 8 bits (μPD75106), 4096 × 8 bits (μPD75104)
	RAM	512 × 4 bits (μPD75108), 320 × 4 bits (μPD75106, 75104)
General-Purpose Register		4 bits × 8 × 4 banks (memory mapped)
Accumulator		Three accumulators selectable according to the bit length of manipulated data: <ul style="list-style-type: none"> • 1-bit accumulator (CY), 4-bit accumulator (A), and 8-bit accumulator (XA)
I/O Port		58 port pins <ul style="list-style-type: none"> • CMOS input pins: 10 • CMOS I/O pins (can directly drive LEDs): 32 • Medium voltage N-ch open-drain I/O pins: 12 (can directly drive LEDs. Pull-up resistor can be connected to each bit) • Comparator input pins (4-bit accuracy): 4
Timer/Counter		<ul style="list-style-type: none"> • 8-bit timer/event counter × 2 • 8-bit basic interval timer (can be used as watchdog timer)
Serial Interface		<ul style="list-style-type: none"> • 8 bits • LSB first/MSB first mode selectable • Two transfer modes (transfer/reception and reception only modes)
Vector Interrupt		External: 3, Internal: 4
Test Input		External: 2
Standby		<ul style="list-style-type: none"> • STOP and HALT modes
Instruction Set		<ul style="list-style-type: none"> • Various bit manipulation instructions (set, reset, test, Boolean operation) • 8-bit data transfer, compare, operation, increment, and decrement • 1-byte relative branch instructions • GETI instruction constituting 2 or 3-byte instruction with 1 byte
Others		<ul style="list-style-type: none"> • Power-ON reset circuit (mask option) • Bit manipulation memory (bit sequential buffer: 16 bits)
Package		<ul style="list-style-type: none"> • 64-pin plastic shrink DIP (750 mil) • 64-pin plastic QFP (14 × 20 mm)

3. PIN FUNCTIONS

3.1 PORT PINS

Pin Name	I/O	Shared with:	Function	8-Bit I/O	At Reset	I/O Circuit TYPE*1
P00	Input	INT4	4-bit input port (PORT 0)	x	Input	B
P01	I/O	$\overline{\text{SCK}}$				F
P02	I/O	SO				E
P03	Input	SI				B
P10	Input	INT0	4-bit input port (PORT 1)	x	Input	B
P11		INT1				
P12		INT2				
P13		INT3				
P20*3	I/O	PTO0	4-bit I/O port (PORT 2)	x	Input	E
P21*3		PTO1				
P22*3		PCL				
P23*3		—				
P30-P33*3	I/O	—	4-bit programmable I/O port (PORT 3) Can be specified for input or output bitwise.	o	Input	E
P40-P43*3	I/O	—	4-bit I/O port (PORT 4)	o	Input	E
P50-P53*3	I/O	—	4-bit I/O port (PORT 5)	o	Input	E
P60-P63*3	I/O	—	4-bit programmable I/O port (PORT 6) Can be specified for input or output bitwise.	o	Input	E
P70-P73*3	I/O	—	4-bit I/O port (PORT 7)	o	Input	E
P80-P83*3	I/O	—	4-bit I/O port (PORT 8)	o	Input	E
P90-P93*3	I/O	—	4-bit I/O port (PORT 9)	o	Input	E
P120-P123*3	I/O	—	4-bit N-ch open-drain I/O port (PORT 12) Built-in pull-up resistors can be specified in bit units by mask option. Open-drain withstanding voltage: 12 V	o	Input*2	M
P130-P133*3	I/O	—	4-bit N-ch open-drain I/O port (PORT 13) Built-in pull-up resistors can be specified in bit units by mask option. Open-drain withstanding voltage: 12 V	o	Input*2	M
P140-P143*3	I/O	—	4-bit N-ch open-drain I/O port (PORT 14) Built-in pull-up resistors can be specified in bit units by mask option. Open-drain withstanding voltage: 12 V	—	Input*2	M

*1: Circles indicate Schmitt trigger input pins.

2: With drain open: high impedance

With pull-up resistor connected: high level

3: Can directly drive LEDs.

3.2 PINS OTHER THAN PORTS

Pin Name	I/O	Shared with:	Function	At Reset	I/O Circuit TYPE*1
PTH00-PTH03	Input	—	4-bit variable threshold voltage analog input port	—	N
Ti0	Input	—	External event pulse inputs for timer/event counter. Also serves as edge-detected vector interrupt input. 1-bit input also possible.	—	B
Ti1					
PTO0	I/O	P20	Outputs for timer/event counter	Input	E
PTO1		P21			
$\overline{\text{SCK}}$	I/O	P01	Serial clock I/O	Input	F
SO	I/O	P02	Serial data output	Input	E
SI	Input	P03	Serial data input	Input	B
INT4	Input	P00	Edge-detected vectored interrupt input (both rising and falling edges detected)	Input	B
INT0	Input	P10	Edge-detected vectored interrupt inputs (valid edge selectable)	Input	B
INT1		P11			
INT2	Input	P12	Edge-detected testable inputs (rising edge detected)	Input	B
INT3		P13			
PCL	I/O	P22	Clock output	Input	E
X1, X2	—	—	Crystal/ceramic system clock oscillator connections. Input external clock to X1, and signal in reverse phase with X1 to X2.	—	—
$\overline{\text{RESET}}$	Input	—	System reset input (low level active type)	—	B
NC*2	—	—	No Connection	—	—
V _{DD}	—	—	Positive power supply	—	—
V _{SS}	—	—	GND	—	—

*1: Circles indicate Schmitt trigger input pins.

2: Connect the NC pin directly to the V_{DD} pin when μPD75P108B and a printed circuit board are shared.

3.3 PIN INPUT/OUTPUT CIRCUITS

The following shows a simplified input/output circuit diagram for each pin of the μPD75108.

<p>TYPE A</p>  <p>Input buffer of CMOS standard</p>	<p>TYPE E</p>  <p>I/O circuit consisting of Type D push-pull output circuit and Type A input buffer</p>
<p>TYPE B</p>  <p>Schmitt trigger input with hysteresis characteristics</p>	<p>TYPE F</p>  <p>I/O circuit consisting of Type D push-pull output and Type B Schmitt trigger input</p>
<p>TYPE D</p>  <p>Push-pull output that can be set in a output high-impedance state (both P-ch and N-ch are off)</p>	<p>TYPE M</p>  <p>Medium-voltage input buffer (+12 V withstand) P.U.R.: Pull-Up Resistor</p>

3.4 RECOMMENDED PROCESSING OF UNUSED PINS

Pin	Recommended connections
PTH00-PTH03 T10 T11	Connect to V _{SS} or V _{DD}
P00	Connect to V _{SS}
P01-P03	Connect to V _{SS} or V _{DD}
P10-P13	Connect to V _{SS}
P20-P23 P30-P33 P40-P43 P50-P53 P60-P63 P70-P73 P80-P83 P90-P93 P120-P123 P130-P133 P140-P143	Input: Connect to V _{SS} or V _{DD} Output: Open
RESET*1	Connect to V _{DD}
NC*2	Open

*1: Connect this pin to the V_{DD} pin only when a power-ON reset circuit is provided as a mask option.

2: Connect the NC pin to the V_{DD} pin when μPD75P108 and a printed circuit board are shared.

3.5 NOTES ON USING THE P00/INT4, AND RESET PINS

In addition to the functions described in Sections 3.1 and 3.2, an exclusive function for setting the test mode, in which the internal functions of the μPD75108 are tested (solely used for IC tests), is provided to the P00/INT4 and RESET pins.

If a voltage exceeding V_{DD} is applied to either of these pins, the μPD75108 is put into test mode. Therefore, even when the μPD75108 is in normal operation, if noise exceeding the V_{DD} is input into any of these pins, the μPD75108 will enter the test mode, and this will cause problems for normal operation.

As an example, if the wiring to the P00/INT4 pin or the RESET pin is long, stray noise may be picked up and the above mentioned problem may occur.

Therefore, all wiring to these pins must be made short enough to not pick up stray noise. If noise cannot be avoided, suppress the noise using a capacitor or diode as shown in the figure below.

- Connect a diode across P00/INT4 and RESET, and V_{DD} .

- Connect a capacitor across P00/INT4 and RESET, and V_{DD} .

4. MEMORY CONFIGURATION

- Program memory (ROM) ... 8064 \times 8 bits (0000H-1F7FH) : μ PD75108
 - ... 6016 \times 8 bits (0000H-177FH) : μ PD75106
 - ... 4096 \times 8 bits (0000H-0FFFH) : μ PD75104
- 0000H, 0001H : Vector table to which address from which program is started is written after reset
- 0002H-000BH: Vector table to which address from which program is started is written after interrupt
- 0020H-007FH: Table area referenced by GETI instruction

- Data memory (RAM)
 - Data area512 \times 4 bits (000H-1FFH): μ PD75108
 - 320 \times 4 bits (000H-13FH) : μ PD75106, 75104
 - Peripheral hardware area 128 \times 4 bits (F80H-FFFH)

(a) μPD75108

Fig. 4-1 Program Memory Map (1/3)

Remarks: In addition to the above addresses, program can be branched to addresses specified by the PC with the contents of its lower 8 bits changed by BR PCDE or BR PCXA instruction.

(b) μPD75106

Fig. 4-1 Program Memory Map (2/3)

Remarks: In addition to the above addresses, program can be branched to addresses specified by the PC with the contents of its lower 8 bits changed by BR PCDE or BR PCXA instruction.

(c) μPD75106

Fig. 4-1 Program Memory Map (3/3)

Remarks: In addition to the above addresses, program can be branched to addresses specified by the PC with the contents of its lower 8 bits changed by BR PCDE or BR PCXA instruction.

5. PERIPHERAL HARDWARE FUNCTIONS

5.1 PORTS

I/O ports are classified into the following 3 kinds:

- CMOS input (PORT0, 1) : 8
 - CMOS input/output (PORT2, 3, 4, 5, 6, 7, 8, 9): 32
 - N-ch open-drain input/output (PORT12, 13, 14) : 12
-
- Total : 52

Table 5-1 Port Function

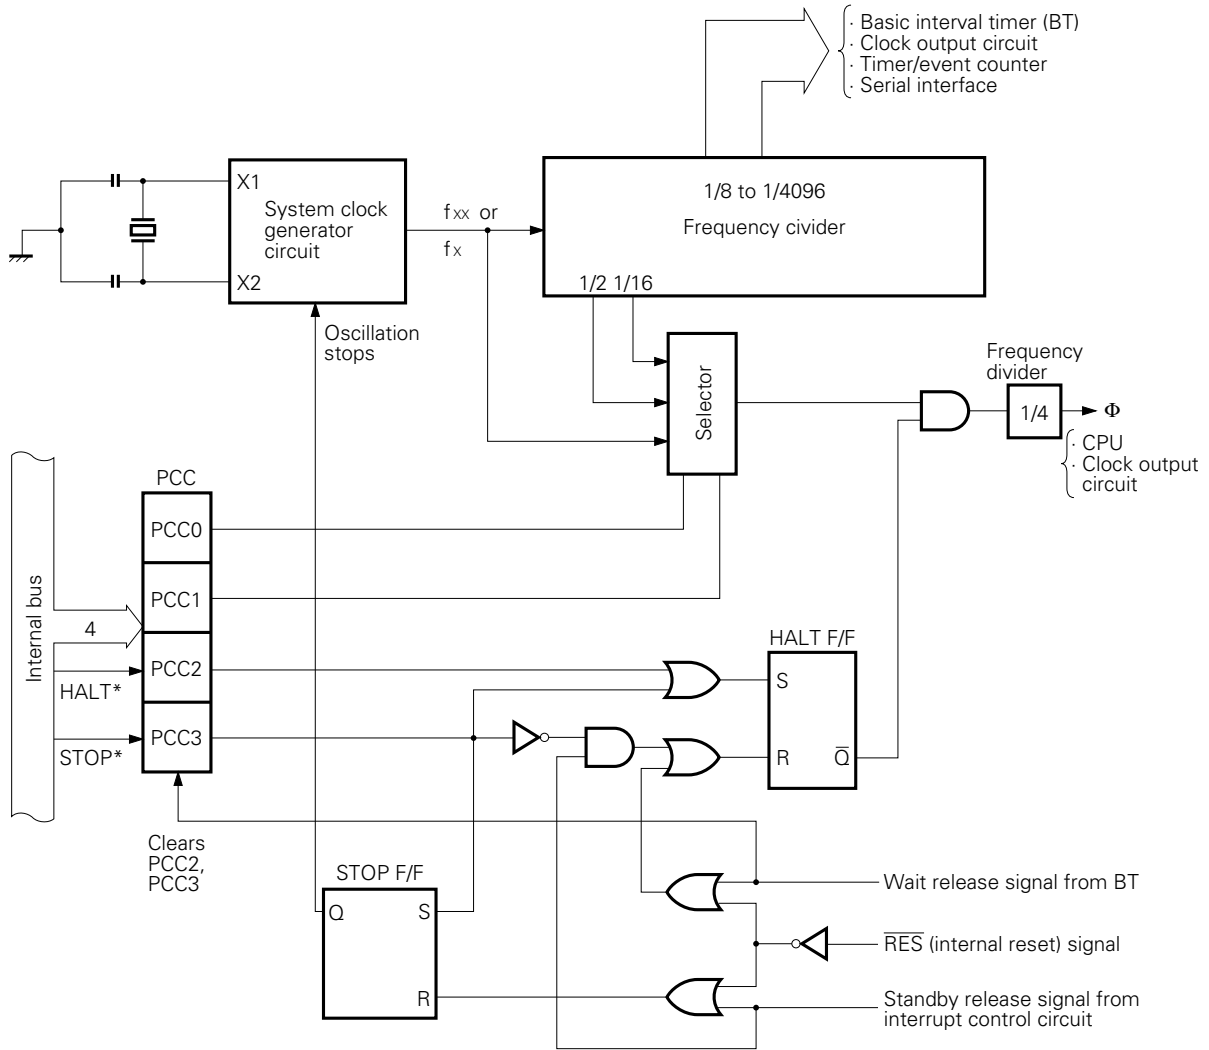

Port (Symbol)	Function	Operation and Features	Remarks	
PORT0 PORT1	4-bit input	Can always be read or tested regardless of operation mode of shared pin	Shared with SI, SO, \overline{SCK} , and INT0 to 4 pins	
PORT3 PORT6	4-bit I/O*	Can be set in input or output mode bitwise	—	
PORT2 PORT4 PORT5 PORT7 PORT8 PORT9		Can be set in input or output mode in units of 4 bits. Ports 4 and 5, 6 and 7, 8 and 9 can be used in pairs to input or output 8-bit data	Port 2 pins are shared with PTO0, PTO1, and PCL pins	
PORT12 PORT13 PORT14		4-bit I/O* (N-ch open-drain. 12V)	Can be set in input or output mode in units of 4 bits. Ports 12 and 13 can be used in pairs to input or output 8-bit data	Each bit can be connected to pull-up resistor by mask option

*: Can directly drive LED.

5.2 CLOCK GENERATOR CIRCUIT

The clock generator circuit generates clocks to control CPU operation modes by supplying clocks to the CPU and peripheral hardware. In addition, this circuit can change the instruction execution time.

- 0.95 μs/1.91 μs/15.3 μs (operating at 4.19 MHz)

*: Execution of the instruction

Remarks 1: f_{xx} = Crystal/ceramic oscillator

2: f_x = External clock frequency

3: PCC: Processor clock control register

4: One clock cycle (t_{cy}) of Φ is one machine cycle of an instruction. For t_{cy} , refer to AC characteristics in 12. ELECTRICAL SPECIFICATIONS. ★

Fig. 5-1 Clock Generator Block Diagram

5.3 CLOCK OUTPUT CIRCUIT

The clock output circuit outputs clock pulse from the P22/PCL pin. This clock output circuit is used to output clock pulses to the remote control output, peripheral LSIs, etc.

- Clock output (PCL) : Φ , 524, 262 kHz (operating at 4.19 MHz)

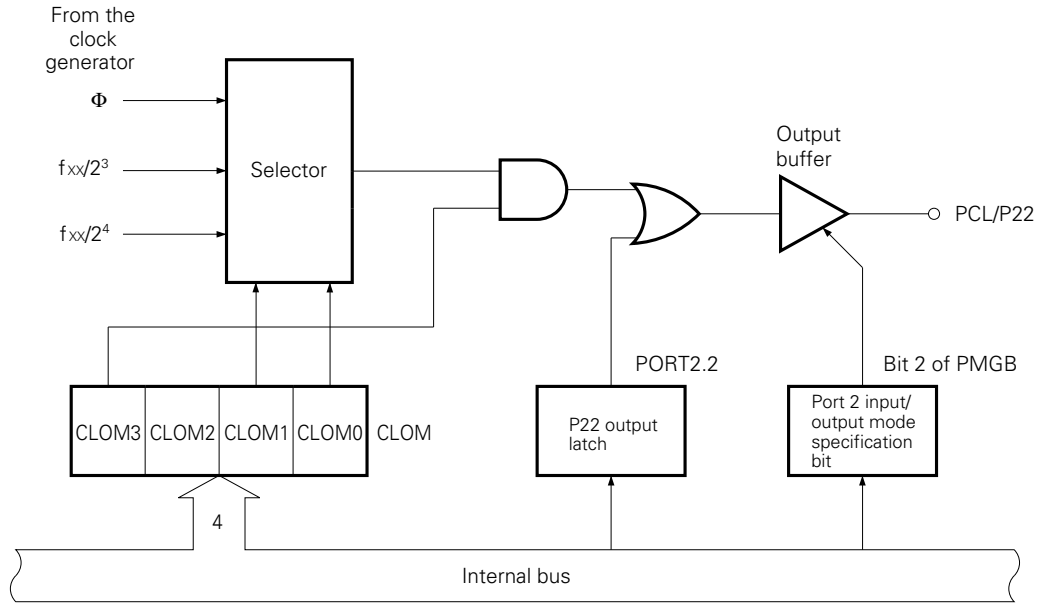

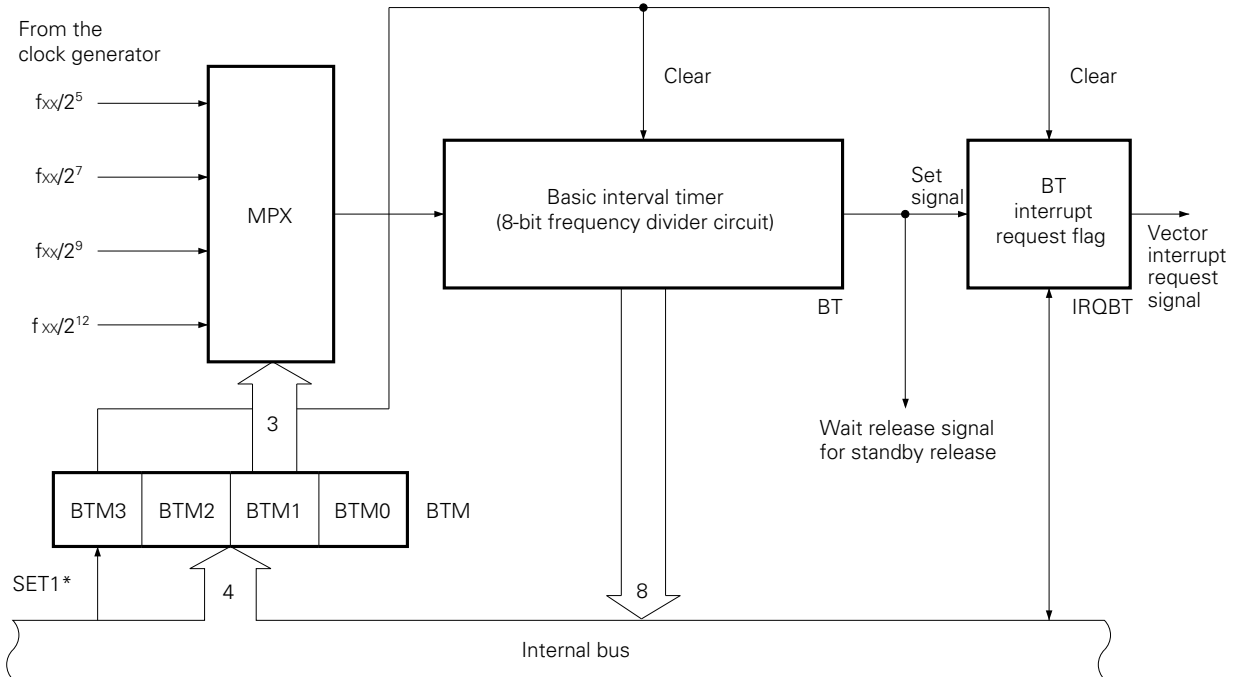

Fig. 5-2 Clock Output Circuit Configuration

5.4 BASIC INTERVAL TIMER

The basic interval timer has these functions:

- Interval timer operation which generates a reference time interrupt
- Watchdog timer application which detects a program runaway
- Selects the wait time for releasing the standby mode and counts the wait time
- Reads out the count value

Remarks : *: Instruction execution

Fig. 5-3 Basic Interval Timer Configuration

5.5 TIMER/EVENT COUNTER

μPD75108 contains two channels of timer/event counters.

These two channels are almost identical in terms of configuration and function except the count pulse (CP) that can be selected and the function to supply clocks to the serial interface.

The functions of the timer/event counter include:

- Programmable interval timer operation
- Output of square wave at an arbitrary frequency to PTO_n pin
- Event counter operation
- Input of TIn pin signal as external interrupt input signal
- Dividing TIn pin input by N to output to PTO_n pin (frequency divider operation)
- Supply of serial shift clock to serial interface circuit (channel 0 only)
- Reading counting status

5.6 SERIAL INTERFACE

The μ PD75108 is equipped with clock 8-bit serial interface that operates in the following two modes:

- Operation stop mode
- Three-line serial I/O mode

5.7 PROGRAMMABLE THRESHOLD PORT (ANALOG INPUT PORT)

μPD75108 is equipped with a 4-bit analog input port (consisting of PTH00 to PTH03 pins) whose threshold voltage is programmable.

This programmable threshold port is configured as shown in Figure 5-6.

The threshold voltage (V_{REF}) can be changed in 16 steps ($V_{DD} \times 0.5/16 - V_{DD} \times 15.5/16$), and analog signals can be directly input.

When V_{REF} is set to $V_{DD} \times 7.5/16$, the programmable threshold port can also be used as a digital signal input port.

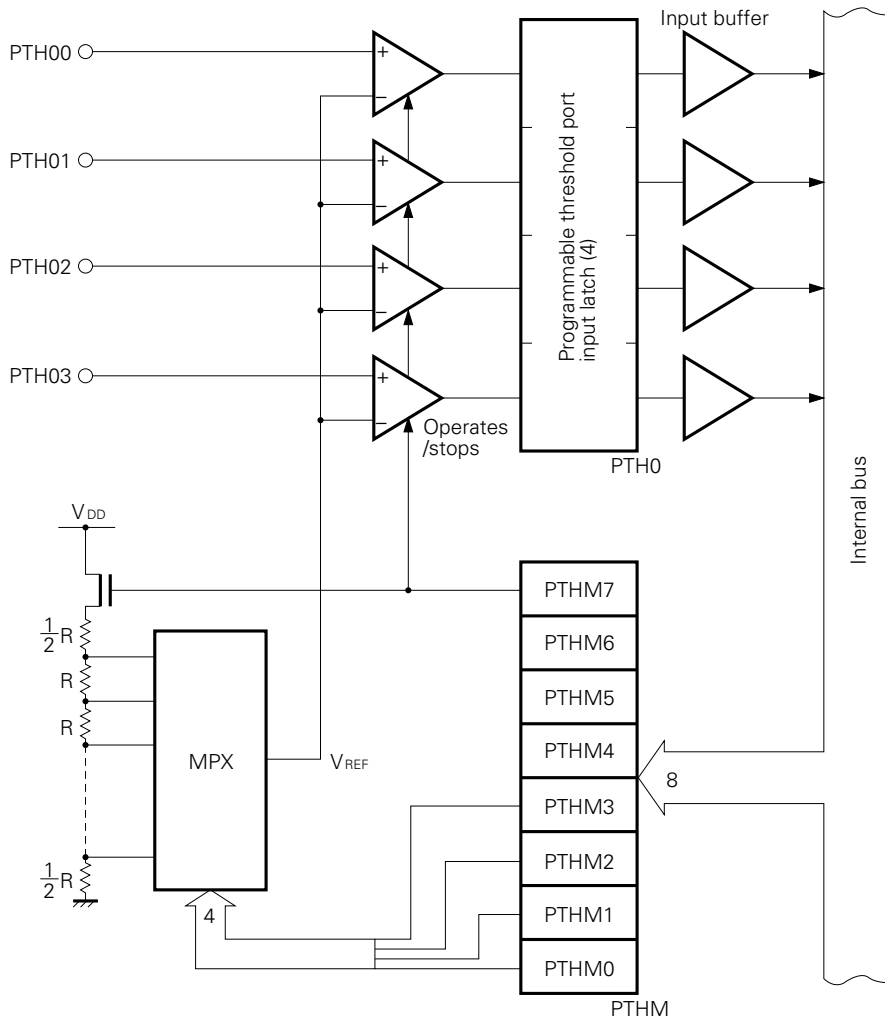

Fig. 5-6 Programmable Threshold Port Configuration

5.8 BIT SEQUENTIAL BUFFER 16 BITS

The bit sequential buffer is a data memory specifically provided for bit manipulation. With this buffer, addresses and bit specifications can be sequentially up-dated in bit manipulation operation. Therefore, this buffer is very useful for processing long data in bit units.

Remarks: For the pmem.@L addressing, the specification bit is shifted according to the L register.

Fig. 5-7 Bit Sequential Buffer Format

5.9 POWER-ON FLAG (MASK OPTION)

The power-ON flag (PONF) is set to only when the power-ON reset circuit operates and power-ON reset signal has been generated (see Fig. 8-1).

The PONF flag is mapped at bit 0 of memory space address FD1H, and can be manipulated by a bit manipulation instruction. However, it cannot be set by the SET1 instruction.

6. INTERRUPT FUNCTIONS

The μPD75108 has 7 different interrupt sources and can perform multiplexed interrupt processing with priority assigned.

In addition to that, the μPD75108 is also provided with two types of edge detection testable inputs.

The interrupt control circuit of the μPD75108 has these functions:

- Hardware controlled vector interrupt function which can control whether or not to accept an interrupt by using the interrupt enable flag (IE_{xxx}) and interrupt master enable flag (IME).
- The interrupt start address can be arbitrarily set.
- Multiplexed interrupt function that can specify priority by the interrupt priority selector register (IPS).
- Interrupt request flag (IRQ_{xxx}) test function (an interrupt generation can be confirmed by means of software).
- Standby mode release (Interrupts to be released can be selected by the interrupt enable flag).

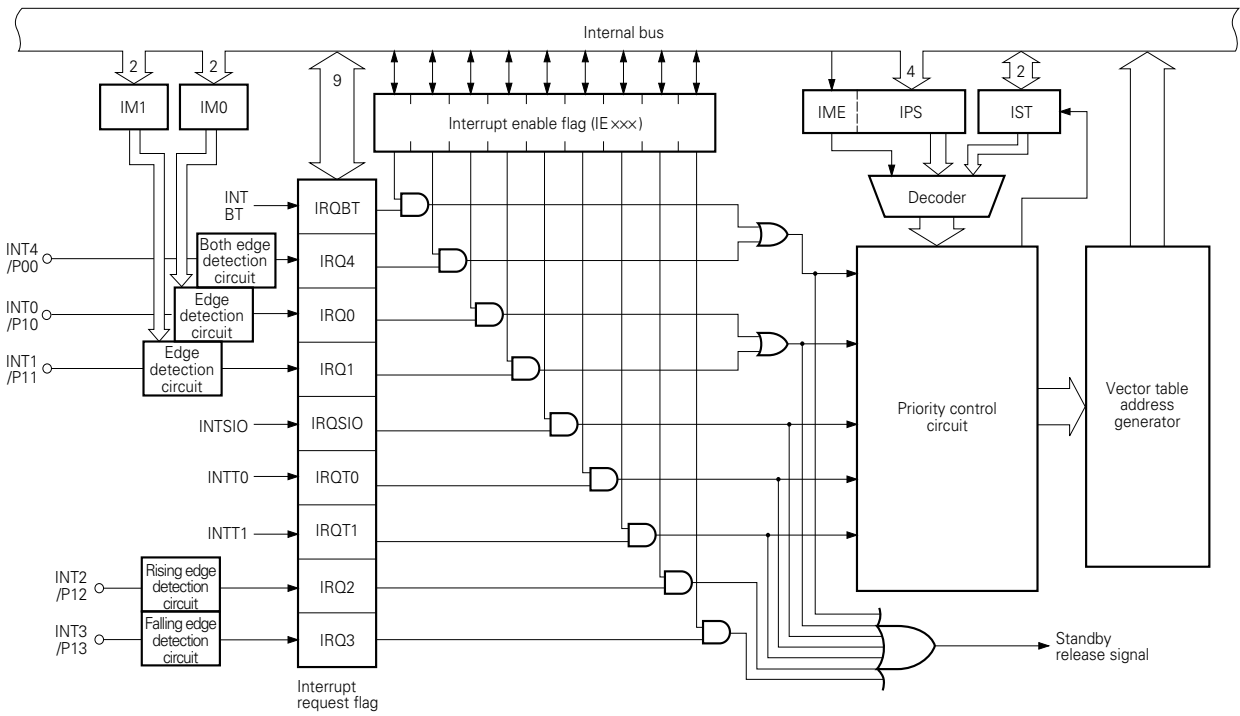

Fig. 6-1 Interrupt Control Block Diagram

7. STANDBY FUNCTIONS

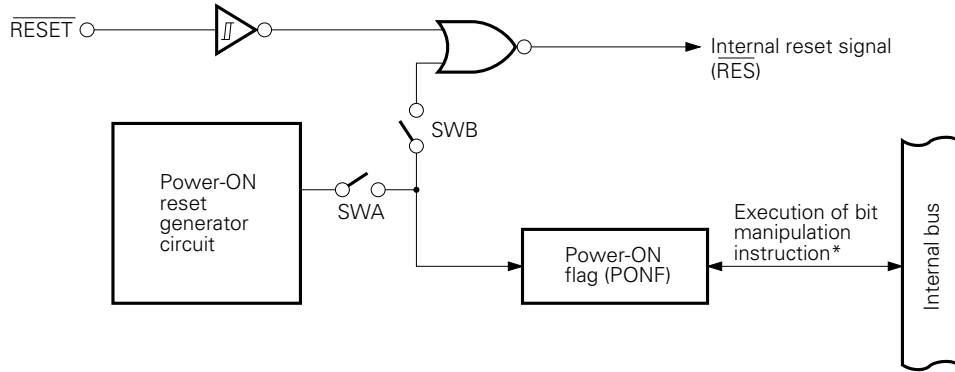

The μPD75108 has two different standby modes (STOP mode and HALT mode) to reduce the power consumption of the microcomputer chip while waiting for program execution.

Table 7-1 Each Status in Standby Mode

		STOP Mode	HALT Mode
Setting Instruction		STOP instruction	HALT instruction
Operation Status	Clock Generator circuit	Clock oscillation stops	Only CPU clock Φ is stopped
	Basic Interval Timer	Stops	Operates (sets IRQBT at reference time intervals)
	Serial Interface	Operates only when input of external \overline{SCK} or output of T00 is selected as serial clock (where external T10 is input to timer/event counter 0)	Operates when serial clock other than Φ is specified
	Timer/Event Counter	Operates only when TIn pin input signal is specified as count clock	Operates
	Clock output circuit	Stops	Operates when clock other than CPU clock Φ is used
	CPU	Stops	Stops
Release Signal		Interrupt request signal enabled by interrupt enable flag, or \overline{RESET} input	

8. RESET FUNCTION

The reset ($\overline{\text{RES}}$) signal generator circuit is configured as shown in Figure 8-1.

*: PONF cannot be set to 1 by SET1 instruction.

Fig. 8-1 Reset Signal Generator Circuit

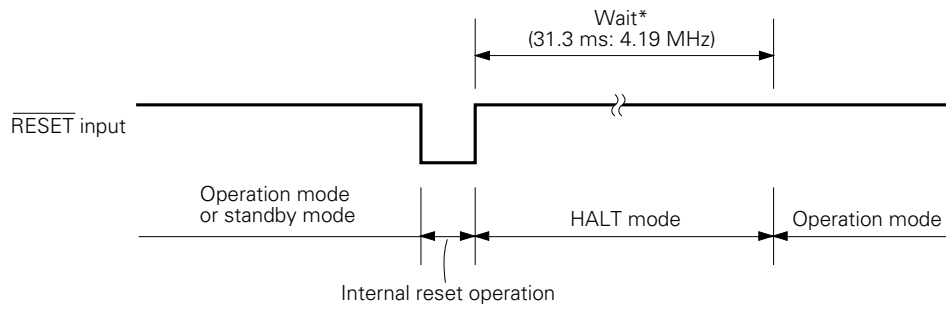

The Power-ON reset generator circuit generates an internal reset signal when the supply voltage rises. This pulse can be used in three ways by specifying a mask option through SWA and SWB shown in Fig. 8-1. (Refer to 11. MASK OPTION SELECTION.)

The reset operations performed by the Power-On reset circuit and the RESET input signal are illustrated in Figs. 8-2 and 8-3, respectively.

*: The wait time does not include the time required after the $\overline{\text{RES}}$ signal has been generated until the oscillation starts.

Fig. 8-2 Reset by Power-ON Reset Circuit

*: The wait time does not include the time required after the $\overline{\text{RES}}$ signal has been generated until the oscillation starts.

Fig. 8-3 Reset by $\overline{\text{RESET}}$ Signal

The status of each internal hardware device after the reset operation has been performed is shown in Table 8-

1.

Table 8-1 Hardware Device Status After Reset

Hardware		$\overline{\text{RESET}}$ input during standby mode	Power-ON Reset or $\overline{\text{RESET}}$ Input during Operation
Program Counter (PC)		Lower 4 bits of program memory address 000H are set to PC ₁₂₋₈ ,*1 and contents of address 001H are set to PC ₇₋₀ .	Lower 4 bits of program memory address 000H are set to PC ₁₂₋₈ ,*1 and contents of address 001H are set to PC ₇₋₀ .

	I/O Mode Registers (PMGA, PMGB, PMGC)	0	0
Analog Port	PTH00-PTH03 Input Latches	Undefined	Undefined
	Mode Register (PTHM)	0	0
Power-ON Flag (PONF)		Retained	1 or undefined*2
Bit Sequential Buffer (BSB0-BSB3)		0	0

*1: PC₁₁₋₈ for μPD75104

2: Power-ON reset: 1

$\overline{\text{RESET}}$ input during operation: undefined

Note: Data at data memory addresses 0F8H to 0FDH become undefined when the $\overline{\text{RESET}}$ signal has been input.

9. INSTRUCTION SET

(1) Operand representation and description

Describe one or more operands in the operand field of each instruction according to the operand representation and description methods of the instruction (for details, refer to RA75X Assembler Package User's Manual - Language (EEU-730)). With some instructions, only one operand should be selected from several operands. The uppercase characters, +, and - are keywords and must be described as is.

Describe an appropriate numeric value or label as immediate data.

The symbols in the register and flag symbols can be described as labels in the places of mem, fmem, pmem, and bit (for details, refer to μPD751XX Series User's Manual (IEM-922)). However, fmem and pmem restricts the label that can be described.

Representation	Description	
reg	X, A, B, C, D, E, H, L	
reg1	X, B, C, D, E, H, L	
rp	XA, BC, DE, HL	
rp1	BC, DE, HL	
rp2	BC, DE	
rp'	XA, BC, DE, HL, XA', BC', DE', HL'	
rp'1	BC, DE, HL, XA', BC', DE', HL'	
rpa	HL, HL+, HL-, DE, DL	
rpa1	DE, DL	
n4	4-bit immediate data or label	
n8	8-bit immediate data or label	
mem	8-bit immediate data or label*	
bit	2-bit immediate data or label	
fmem	FB0H to FBFH, FF0H to FFFH immediate data or label	
pmem	FC0H to FFFH immediate data or label	
addr	μPD75104	0000H to 0FFFH immediate data or label
	μPD75106	0000H to 177FH immediate data or label
	μPD75108	0000H to 1F7FH immediate data or label
caddr	12-bit immediate data or label	
faddr	11-bit immediate data or label	
taddr	20H to 7FH immediate data (where bit0 = 0) or label	
PORTn	PORT0 - PORT9, PORT12 - PORT14	
IExxx	IEBT, IESIO, IET0, IET1, IE0 - IE4	
RBn	RBO - RB3	
MBn	MB0, MB1, MB15	

*: Only even address can be described as mem for 8-bit data processing.

(2) Legend of operation field

A	: A register; 4-bit accumulator
B	: B register; 4-bit accumulator
C	: C register; 4-bit accumulator
D	: D register; 4-bit accumulator
E	: E register; 4-bit accumulator
H	: H register; 4-bit accumulator
L	: L register; 4-bit accumulator
X	: X register; 4-bit accumulator
XA	: Register pair (XA); 8-bit accumulator
BC	: Register pair (BC); 8-bit accumulator
DE	: Register pair (DE); 8-bit accumulator
HL	: Register pair (HL); 8-bit accumulator
XA'	: Expansion register pair (XA')
BC'	: Expansion register pair (BC')
DE'	: Expansion register pair (DE')
HL'	: Expansion register pair (HL')
PC	: Program counter
SP	: Stack pointer
CY	: Carry flag; or bit accumulator
PSW	: Program status word
MBE	: Memory bank enable flag
RBE	: Register bank enable flag
PORT _n	: Port n (n = 0 - 9, 12 - 14)
IME	: Interrupt mask enable flag
IPS	: Interrupt priority selection register
IExxx	: Interrupt enable flag
RBS	: Register bank selection register
MBS	: Memory bank selection register
PCC	: Processor clock control register
·	: Delimiter of address and bit
(xx)	: Contents addressed by xx
xxH	: Hexadecimal data

(3) Symbols in addressing area field

*1	MB = MBE · MBS (MBS = 0, 1, 15)		
*2	MB = 0		
*3	MBE = 0 : MB = 0 (00H-7FH) MB = 15 (80H-FFH) MBE = 1 : MB = MBS (MBS = 0, 1, 15)		
*4	MB = 15, fmem = FB0H-FBFH, FF0H-FFFH		
*5	MB = 15, pmem = FC0H-FFFH		
*6	μPD75104	addr = 0000H-0FFFH	
	μPD75106	addr = 0000H-177FH	
	μPD75108	addr = 0000H-1F7FH	
*7	addr = (Current PC) - 15 to (Current PC) - 1 (Current PC) + 2 to (Current PC) + 16		
*8	μPD75104	caddr = 0000H-0FFFH (PC ₁₁ = 0)	
	μPD75106	caddr = 0000H-0FFFH (PC ₁₂ = 0) or 1000H-177FH (PC ₁₂ = 1)	
	μPD75108	caddr = 0000H-0FFFH (PC ₁₂ = 0) or 1000H-1F7FH (PC ₁₂ = 1)	
*9	faddr = 000H-7FFH		
*10	taddr = 020H-07FH		

- Remarks**
- MB indicates memory bank that can be accessed.
 - In *2, MB = 0 regardless of MBE and MBS.
 - In *4 and *5, MB = 15 regardless of MBE and MBS.
 - *6 to *10 indicate areas that can be addressed.

(4) Machine cycle field

In this field, S indicates the number of machine cycles required when an instruction having a skip function skips. The value of S varies as follows:

- When no instruction is skipped S = 0
- When 1-byte or 2-byte instruction is skipped S = 1
- When 3-byte instruction (BR ! adder or CALL ! adder) is skipped S = 2

Note: The GETI instruction is skipped in one machine cycle.

One machine cycle equals to one cycle of the CPU clock Φ, (= t_{cy}), and can be changed in three steps depending on the setting of the processor clock control register (PCC).

10. APPLICATION EXAMPLES

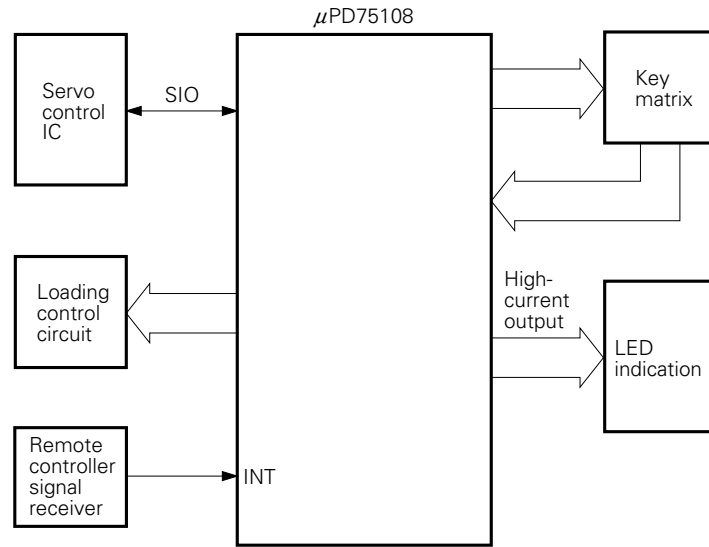

10.1 VTR SYSTEM CONTROLLER

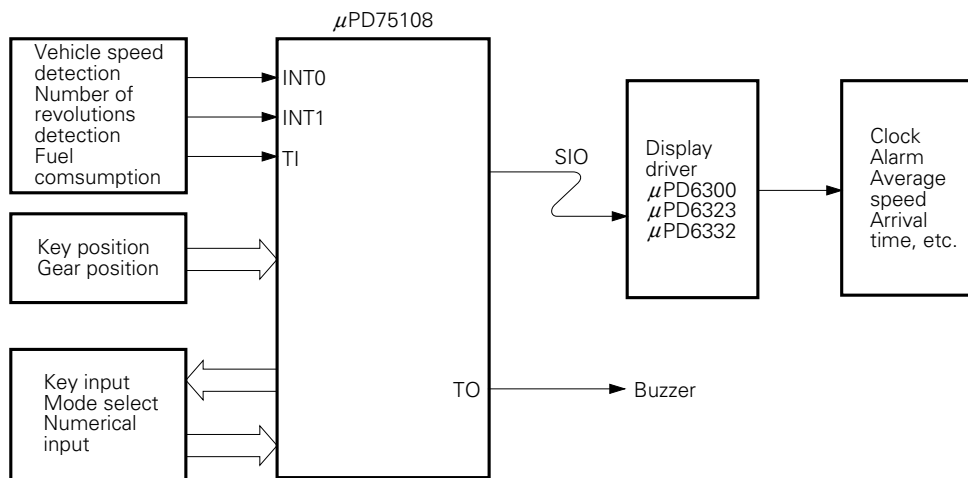

10.2 VTR CAMERA

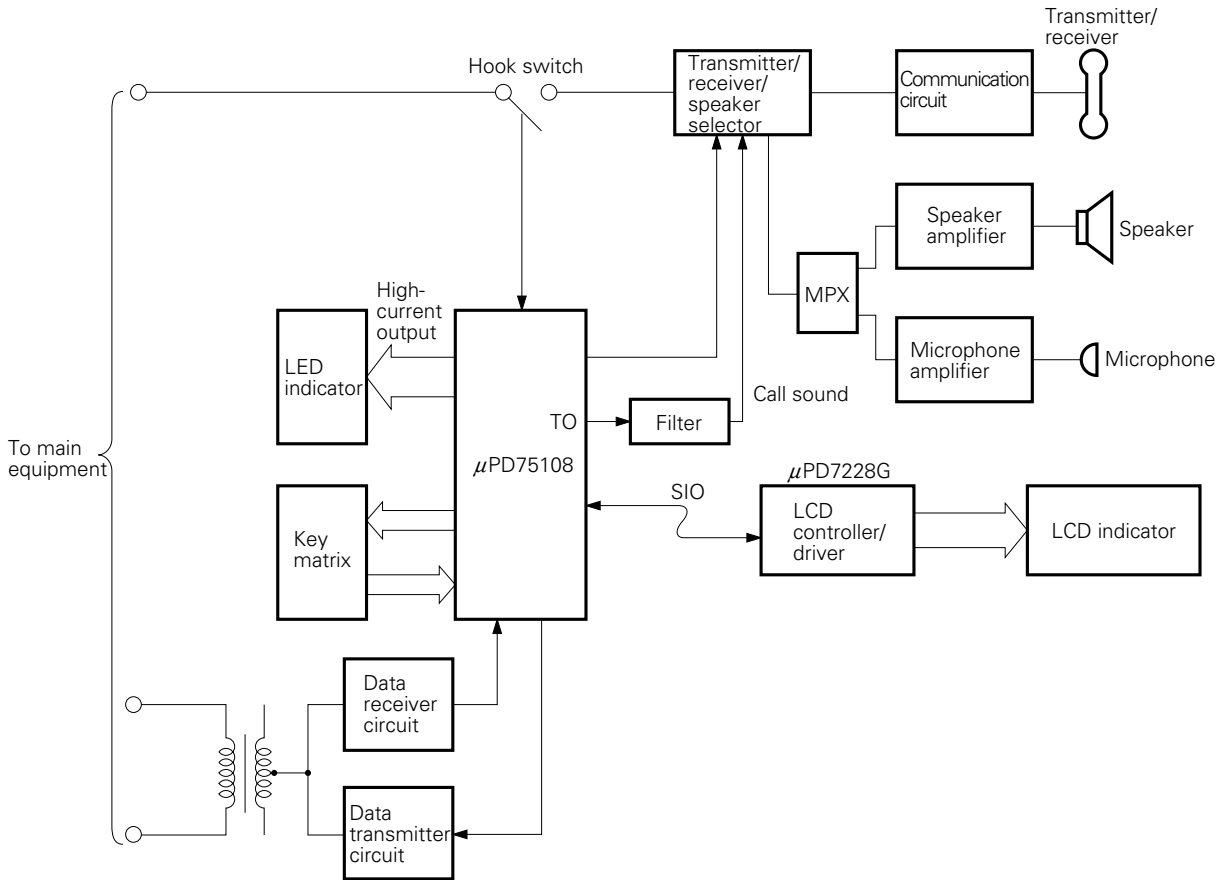

10.3 COMPACT DISC PLAYER

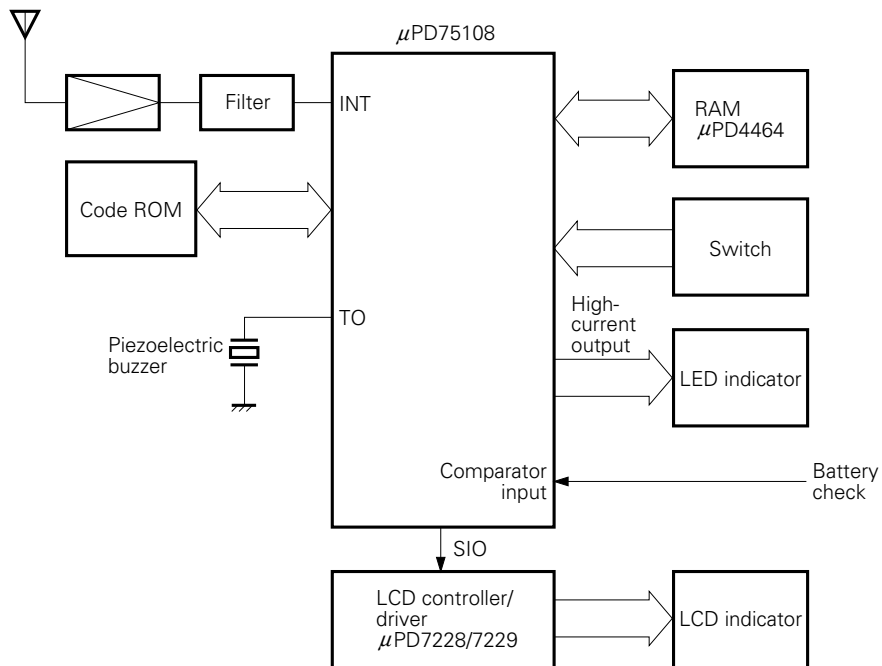

10.4 AUTOMOBILE APPLICATIONS (TRIP COMPUTER)

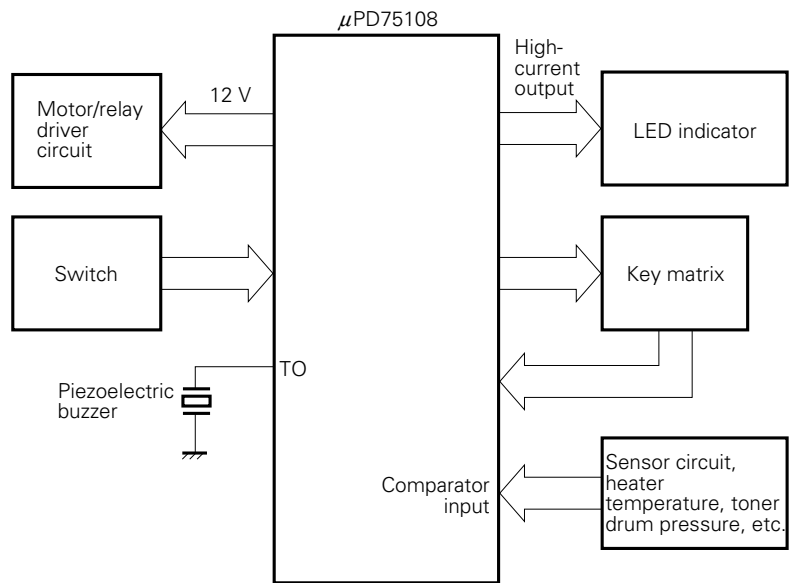

10.5 PUSHBUTTON TELEPHONE

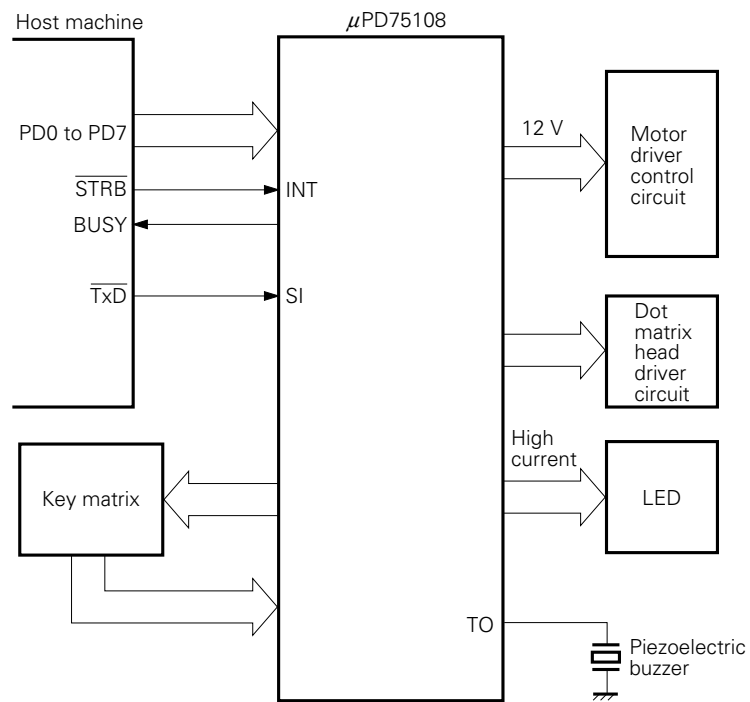

10.6 DISPLAY PAGER

10.7 PLAIN PAPER COPIER (PPC)

10.8 PRINTER CONTROLLER

11. MASK OPTION SELECTION

μPD75108 has the following mask options. Options to be built in can be selected.

(1) Pin

Pin	Mask Option
P120 - P123	Pull-down resistor can be built in bitwise.
P130 - P133	
P140 - P143	

(2) Power-ON reset generation circuit, power-ON flag (PONF)

One from the following three ways can be selected.

Switching Selection (Refer to Fig. 8-1.)		Power-On Reset Generation Circuit	Power-On Flag (PONF)	Internal Reset Signal (RES)
SWA	SWB			
ON	ON	Provided	Provided	Generates automatically
ON	OFF	Provided	Provided	Not generates autoamtically
OFF	OFF	Not provided	Not provided	—

12. ELECTRICAL SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS (T_a = 25°C)

Parameter	Symbol	Conditions		Ratings	Unit
Supply Voltage	V _{DD}			-0.3 to +7.0	V
Input Voltage	V _{I1}	Other than ports 12, 13, 14		-0.3 to V _{DD} +0.3	V
	V _{I2} *1	Ports 12 to 14	w/pull-up resistor	-0.3 to V _{DD} +0.3	V
			Open drain	-0.3 to +13	V
Output Voltage	V _O			-0.3 to V _{DD} +0.3	V
High-Level Output Current	I _{OH}	1 pin		-15	mA
		All pins		-30	mA
Low-Level Output Current	I _{OL} *2	1 pin	Peak	30	mA
			rms	15	mA
		Total of ports 0, 2 to 4, 12 to 14	Peak	100	mA
			rms	60	mA
		Total of ports 5 to 9	Peak	100	mA
			rms	60	mA
Operating Temperature	T _{opt}			-40 to +85	°C
Storage Temperature	T _{stg}			-65 to +150	°C

*1: The power supply impedance (pull-up resistance) must be 50 kΩ or higher when a voltage higher than 10 V is applied to ports 12, 13, and 14.

2: rms = Peak value × √Duty

OSCILLATOR CIRCUIT CHARACTERISTICS

(T_a = -40 to +85°C, V_{DD} = 2.7 to 6.0 V)

Oscillator	Recommended Constants	Item	Conditions	MIN.	TYP.	MAX.	Unit
Ceramic		Oscillation frequency (f _{xx})* ¹	V _{DD} = Oscillation voltage range	2.0		5.0* ³	MHz
		Oscillation stabilization time* ²	After V _{DD} come to MIN. of oscillation voltage range			4	ms
Crystal		Oscillation frequency (f _{xx})* ¹		2.0	4.19	5.0* ³	MHz
		Oscillation stabilization time* ²	V _{DD} = 4.5 to 6.0 V			10	ms
External Clock		X1 input frequency (f _x)* ¹		2.0		5.0* ³	MHz
		X1 input high-, low-level widths (t _{xH} , t _{xL})		100		250	ns

*1: The oscillation frequency and X1 input frequency are indicated only to express the characteristics of the oscillator circuit. For instruction execution time, refer to AC Characteristics.

2: Time required for oscillation to stabilize after V_{DD} has come to MIN. of oscillation voltage range or the STOP mode has been released.

3: When the oscillation frequency is 4.19 MHz < f_x ≤ 5.0 MHz, do not select PCC = 0011 as the instruction execution time: otherwise, one machine cycle is set to less than 0.95 μs, falling short of the rated minimum value of 0.95 μs. ★

Note: When using the oscillation circuit of the system clock, wire the portion enclosed in dotted line in the figures as follows to avoid adverse influences on the wiring capacity: ★

- Keep the wiring length as short as possible.
- Do not cross the wiring over the other signal lines. Also, do not route the wiring in the vicinity of lines through which a high alternating current flows.
- Always keep the ground point of the capacitor of the oscillator circuit at the same potential as V_{SS}. Do not connect the ground pattern through which a high current flows.
- Do not extract signals from the oscillation circuit.

RECOMMENDED OSCILLATOR CIRCUITS CONSTANTS

RECOMMENDED CERAMIC OSCILLATORS

Manufacturer	Product Name	External Capacitance (pF)		Oscillation Voltage Range (V)	
		C1	C2	MIN.	MAX.
Murata Mfg. Co., Ltd.	CSA 2.00MG	30	30	2.7	6.0
	CSA 4.19MG	30	30	3.0	6.0
	CSA 4.19MGU	30	30	2.7	6.0
	CST 4.19T	Provided	Provided	3.0	6.0

I _{DD3}	STOP mode, V _{DD} = 3 V±10%				0.1	10	μA	

*1: The current flowing into the internal pull-up resistor, power-ON reset circuit (mask option), and comparator circuit is not included.

- 2: When the high-speed mode is set by setting the processor clock control register (PCC) to 0011.
- 3: When the low-speed mode is set by setting the PCC to 0000.

CAPACITANCE ($T_a = 25^\circ\text{C}$, $V_{DD} = 0\text{ V}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Input Capacitance	C_{IN}	$f = 1\text{ MHz}$ Pins other than those measured are at 0 V			15	pF
Output Capacitance	C_{OUT}				15	pF
Input/Output Capacitance	C_{IO}				15	pF

COMPARATOR CHARACTERISTICS ($T_a = -40\text{ to }+85^\circ\text{C}$, $V_{DD} = 4.5\text{ to }6.0\text{ V}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Comparison Accuracy	V_{ACOMP}				± 100	mV
Threshold Voltage	V_{TH}		0		V_{DD}	V
PTH Input voltage	V_{IPTH}		0		V_{DD}	V
Comparator circuit current dissipation		PTHM7 is set to "1"		1		mA

POWER-ON RESET CIRCUIT CHARACTERISTICS (MASK OPTION) ($T_a = -40\text{ to }+85^\circ\text{C}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Power-On Reset High-Level Operating Voltage	V_{DDH}		4.5		6.0	V
Power-On Reset Low-Level Operating Voltage	V_{DDL}		0		0.2	V
Supply Voltage Rise Time	t_r		10		*1	μs
Supply Voltage Off Time	t_{off}		1			s
Power-On Reset Circuit Current Dissipation*2	I_{DDPR}	$V_{DD} = 5\text{ V} \pm 10\%$		10	100	μA
		$V_{DD} = 2.5\text{ V}$		2	20	μA

*1: $2^{17}/f_{XX}$ (31.3 ms at $f_{XX} = 4.19\text{ MHz}$)

2: Current flowing when power-ON reset circuit or power-ON Flag is incorporated.

Note: Apply power gradually and smoothly.

AC CHARACTERISTICS (T_a = -40 to +85°C, V_{DD} = 2.7 to 6.0 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
CPU Clock Cycle Time* (Minimum Instruction Execution Time = 1 Machine Cycle)	t _{cy}	V _{DD} = 4.5 to 6.0 V	0.95		32	μs
			3.8		32	μs
T10, T11 Input Frequency	f _{T1}	V _{DD} = 4.5 to 6.0 V	0		1	MHz
			0		275	kHz
T10, T11 Input High-/Low-Level Width	t _{TIH} , t _{TIL}	V _{DD} = 4.5 to 6.0 V	0.48			μs
			1.8			μs
SCK Cycle Time	t _{KCY}	V _{DD} = 4.5 to 6.0 V	Input	0.8		μs
			Output	0.95		μs
			Input	3.2		μs
			Output	3.8		μs
SCK High-/Low-Level Width	t _{KH} , t _{KL}	V _{DD} = 4.5 to 6.0 V	Input	0.4		μs
			Output	t _{KCY} /2-50		ns
			Input	1.6		μs
			Output	t _{KCY} /2-150		ns
SI Setup Time (vs. SCK↑)	t _{SIK}		100			ns
SI Hold Time (vs. SCK↑)	t _{ksi}		400			ns
SCK ↓→ SO Output delay Time	t _{KSO}	V _{DD} = 4.5 to 6.0 V			300	ns
					1000	ns
INT0 to 4 High-/Low-Level Width	t _{INTH} , t _{INTL}		5			μs
RESET Low-Level Width	t _{RSL}		5			μs

*: The cycle time of the CPU clock (Φ) is determined by the input frequency of the ceramic or crystal oscillator circuit and the set value of the processor clock control register. The t_{cy} vs. V_{DD} characteristics are as shown on the right.

AC TIMING MEASURING POINTS (excluding Ports 0, 1, TI0, TI1, X1, X2, and RESET)

CLOCK TIMING

TI TIMING

SERIAL TRANSFER TIMING

INTERRUPT INPUT TIMING

RESET INPUT TIMING

LOW-VOLTAGE DATA RETENTION CHARACTERISTICS OF DATA MEMORY IN STOP MODE

(T_a = -40 to +85°C)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Data Retention Supply Voltage	V _{DDDR}		2.0		6.0	V
Data Retention Supply Current*1	I _{DDDR}	V _{DDDR} = 2.0 V		0.1	10	μA
Release Signal Set Time	t _{SREL}		0			μs
Oscillation Stabilization Wait Time*2	t _{WAIT}	Released by $\overline{\text{RESET}}$		2 ¹⁷ /f _x		ms
		Released by interrupt request		*3		ms

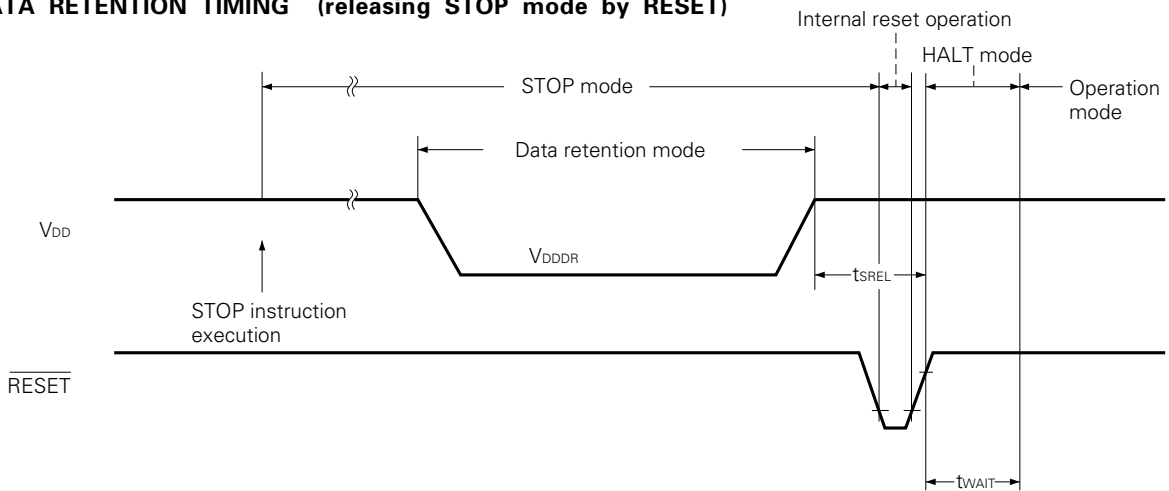

*1: The current flowing through internal pull-up resistor, power-ON reset circuit (mask option), and comparator circuit is not included

*2: The oscillation stabilization wait time is the time during which the CPU is stopped to prevent unstable operation when oscillation is started.

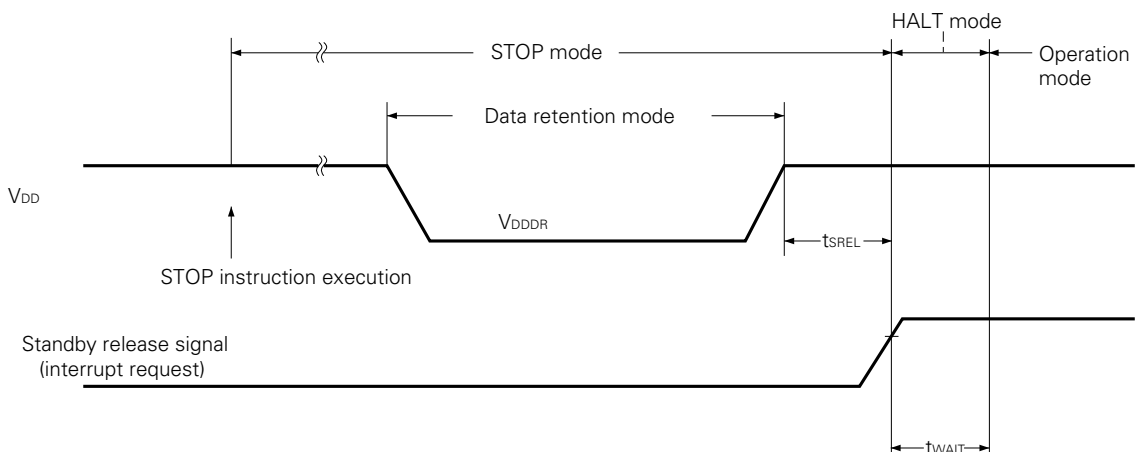

*3: Depends on the setting of the basic interval timer mode register (BTM) as follows:

BTM3	BTM2	BTM1	BTM0	Wait time (): f _{xx} = 4.19 MHz
-	0	0	0	2 ²⁰ /f _{xx} (approx. 250 ms)
-	0	1	1	2 ¹⁷ /f _{xx} (approx. 31.3 ms)
-	1	0	1	2 ¹⁵ /f _{xx} (approx. 7.82 ms)
-	1	1	1	2 ¹³ /f _{xx} (approx. 1.95 ms)

DATA RETENTION TIMING (releasing STOP mode by $\overline{\text{RESET}}$)

DATA RETENTION TIMING (standby release signal: releasing STOP mode by interrupt)

ES 64-Pin Ceramic QFP (Reference) (unit in mm)

- Note 1.** The metal cap is connected to pin 26, at the V_{SS} (GND) level.
- 2.** The leads are molded diagonally at the bottom.
- 3.** The lead lengths are not specified, as the lead cutting process is not controlled.

15. RECOMMENDED SOLDERING CONDITIONS

It is recommended that μPD75104, 75106, and 75108 be soldered under the following conditions.

For details on the recommended soldering conditions, refer to Information Document "Semiconductor Devices Mounting Manual" (IEI-616).

For other soldering methods and conditions, please consult NEC.

Table 15-1 Soldering Conditions of Surface Mount Type

μPD75108GF - xxx - 3BE: 64-pin plastic QFP (14 x 20 mm)

Soldering Method	Soldering Conditions	Symbol for Recommended Condition
Infrared Reflow	Package peak temperature: 230°C, time: 30 seconds max. (210°C min.), number of times: 1	IR30-00-1
VPS	Package peak temperature: 215°C, time: 40 seconds max. (200°C min.), number of times: 1	VP15-00-1
Wave Soldering	Soldering bath temperature: 260°C max., time: 10 seconds max., number of times: 1, pre-heating temperature: 120°C max. (package surface temperature)	WS60-00-1
Pin Partial Heating	Pin temperature: 300°C max., time: 3 seconds max. (per side)	—

Caution: Do not use two or more soldering methods in combination (except the pin partial heating method).

Table 15-2 Soldering Conditions of Through-Hole Type

μPD75108CW - xxx : 64-pin plastic shrink DIP (750 mil)

Soldering Method	Soldering Conditions
Wave Soldering (Only for lead part)	Soldering bath temperature: 260°C max., Time: 10 seconds max.
Pin Partial Heating	Pin temperature: 260°C max., Time: 10 seconds max.

Caution: The wave soldering must be performed at the lead part only. Note that the solder must not be directly contacted to the package body.

APPENDIX B. DEVELOPMENT TOOLS

The following development support tools are readily available to support development of systems using μPD75108:

Hardware	IE-75000-R* ¹ IE-75001-R	In-circuit emulator for 75X series
	IE-75000-R-EM* ²	Emulation board for IE-75000-R and IE-75001-R
	EP-75108CW-R	Emulation prove for μPD75108CW
	EP-75108GF-R EV-9200G-64	Emulation prove for μPD75108GF. It is provided with a 64-pin conversion socket, EV-9200G-64
	PG-1500	PROM programmer
	PA-75P108CW	PROM programmer adapter for μPD75P108BCW and 75P108BDW. It is connected to PG-1500.
	PA-75P116GF	Programmer adapter for μPD75P108BGF. It is connected to PG-1500.
Software	IE Control Program	Host machine
	PG-1500 Controller	PC-9800 series (MS-DOS™ Ver.3.30 to Ver.5.00A* ³)
	RA75X Relocatable Assembler	IBM PC/AT™ (PC DOS™ Ver.3.1)

*1: Maintenance product

2: Not provided with IE-75001-R.

3: Ver.5.00/5.00A has a task swap function, but this function cannot be used with this function.

Remarks: For development tools from other companies, refer to 75X Series Selection Guide (IF-151).

APPENDIX C. RELATED DOCUMENTS

GENERAL NOTES ON CMOS DEVICES**① STATIC ELECTRICITY (ALL MOS DEVICES)**

Exercise care so that MOS devices are not adversely influenced by static electricity while being handled.

The insulation of the gates of the MOS device may be destroyed by a strong static charge. Therefore, when transporting or storing the MOS device, use a conductive tray, magazine case, or conductive buffer materials, or the metal case NEC uses for packaging and shipment, and use grounding when assembling the MOS device system. Do not leave the MOS device on a plastic plate and do not touch the pins of the device.

Handle boards on which MOS devices are mounted similarly .

② PROCESSING OF UNUSED PINS (CMOS DEVICES ONLY)

Fix the input level of CMOS devices.

Unlike bipolar or NMOS devices, if a CMOS device is operated with nothing connected to its input pin, intermediate level input may be generated due to noise, and an inrush current may flow through the device, causing the device to malfunction. Therefore, fix the input level of the device by using a pull-down or pull-up resistor. If there is a possibility that an unused pin serves as an output pin (whose timing is not specified), each pin should be connected to V_{DD} or GND through a resistor.

Refer to "Processing of Unused Pins" in the documents of each devices.

③ STATUS BEFORE INITIALIZATION (ALL MOS DEVICES)

The initial status of MOS devices is undefined upon power application.

Since the characteristics of an MOS device are determined by the quantity of injection at the molecular level, the initial status of the device is not controlled during the production process. The output status of pins, I/O setting, and register contents upon power application are not guaranteed. However, the items defined for reset operation and mode setting are subject to guarantee after the respective operations have been executed.

When using a device with a reset function, be sure to reset the device after power application.

[MEMO]
