

TDMA ANTENNA SWITCH GaAs MMIC

■GENERAL DESCRIPTION

NJG1520PE1 is an antenna switch IC for a digital cellular phone of 800MHz and 1.5GHz band.

The parallel control signals of three bits connect T/R circuits to internal two antennas or external two antennas.

The termination ports with external matching circuits make low interference between diversity antennas.

The Ultra small & thin FFP24-E1 package is applied.

■ TERMINAL INFORMATION

PIN No.	SYMBOL	DESCRIPTION
1	V _{SS}	Negative voltage supply terminal. Please supply negative voltage of -3.5~-2.0V on transmitting state. On receiving state, this terminal is internally disconnected, so the voltage of this terminal(negative, short, or open) does not affect to receiving signal quality. The bypass capacitor should be connected between this terminal and GND for excellent RF performance.
2	CTL3	High-impedance C-MOS input terminal. This terminal is set to High-Level (+2V~V _{DD}) or Low-Level (+0.6V~0V). If the voltage level of this terminal is unstable, please connect a resistor (100KΩ) with GND terminal or V _{DD} terminal.
3	CTL2	High-impedance C-MOS input terminal. This terminal is set to High-Level (+2V~V _{DD}) or Low-Level (+0.6V~0V). If the voltage level of this terminal is unstable, please connect a resistor (100KΩ) with GND terminal or V _{DD} terminal.
5	CTL1	High-impedance C-MOS input terminal. This terminal is set to High-Level (+2V~V _{DD}) or Low-Level (+0.6V~0V). If the voltage level of this terminal is unstable, please connect a resistor (100KΩ) with GND terminal or V _{DD} terminal.
6	V _{DD}	Positive voltage supply terminal. The positive voltage (+2.7~+5.0V) have to be supplied. Please connect a bypass capacitor with GND terminal for excellent RF performance.
10	TER1	ANT2 termination port. Please connect this port and GND by appropriate capacitor (5pF) to suppress the interference of ANT2 port signal to ANT1 port. The capacitor works as DC voltage (V _{DD}) blocking.
12	RX	RF receiving port. An external capacitor (56pF~100pF) is required to block DC voltage (V _{DD}) .
14	ANT1	RF transmitting/receiving port. An external capacitor (56pF~100pF) is required to block DC voltage (V _{DD}) .
16	ANT2	RF receiving port. An external capacitor (56pF~100pF) is required to block DC voltage (V _{DD}).
17	TER2	ANT2 termination port. Please connect this port and GND by appropriate capacitor (10pF) to suppress the interference of ANT1 port signal to ANT2 port. The capacitor works as DC voltage (V _{DD}) blocking.
19	TX	RF transmitting port. An external capacitor of 56pF~100pF is required to block DC voltage (V _{DD}).
21	EXT1	RF transmitting/receiving port. An external capacitor of 56pF~100pF is required to block DC voltage (V _{DD}).
23	EXT2	RF receiving port. An external capacitor of 56pF~100pF is required to block DC voltage (V _{DD}).
4, 7, 8, 9, 11, 13, 15, 18, 20, 22, 24	GND	Ground terminal. Please connect this terminal with ground plane as close as possible for excellent RF performance.
