

4-BIT SINGLE CHIP OTP MICRO CONTROLLER

■ GENERAL DESCRIPTION

The **NJU3553** is the C-MOS 4-bit Single Chip OTP type Micro Controller with programmable Flash Memory.

It is completely compatible with the **NJU3503** in function and the pin configuration. Therefore, the **NJU3553** is suitable for the final evaluation before **NJU3503** mask generation, the small quantity production and short lead-time.

* In this data sheet, only OTP programming and the difference between **NJU3553** and **NJU3503** are mentioned mainly. Therefore the detail function and specification should be referred on the **NJU3503** data sheet.

■ PACKAGE OUTLINE

NJU3553L

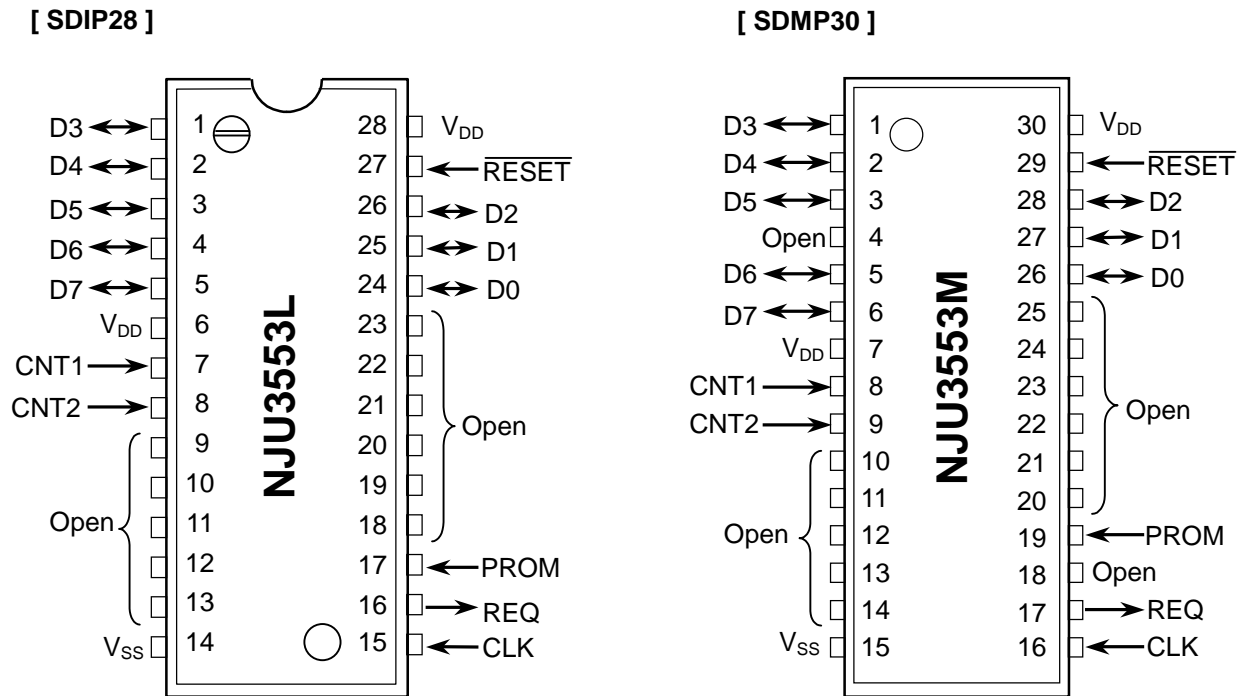

NJU3553M

■ FEATURES

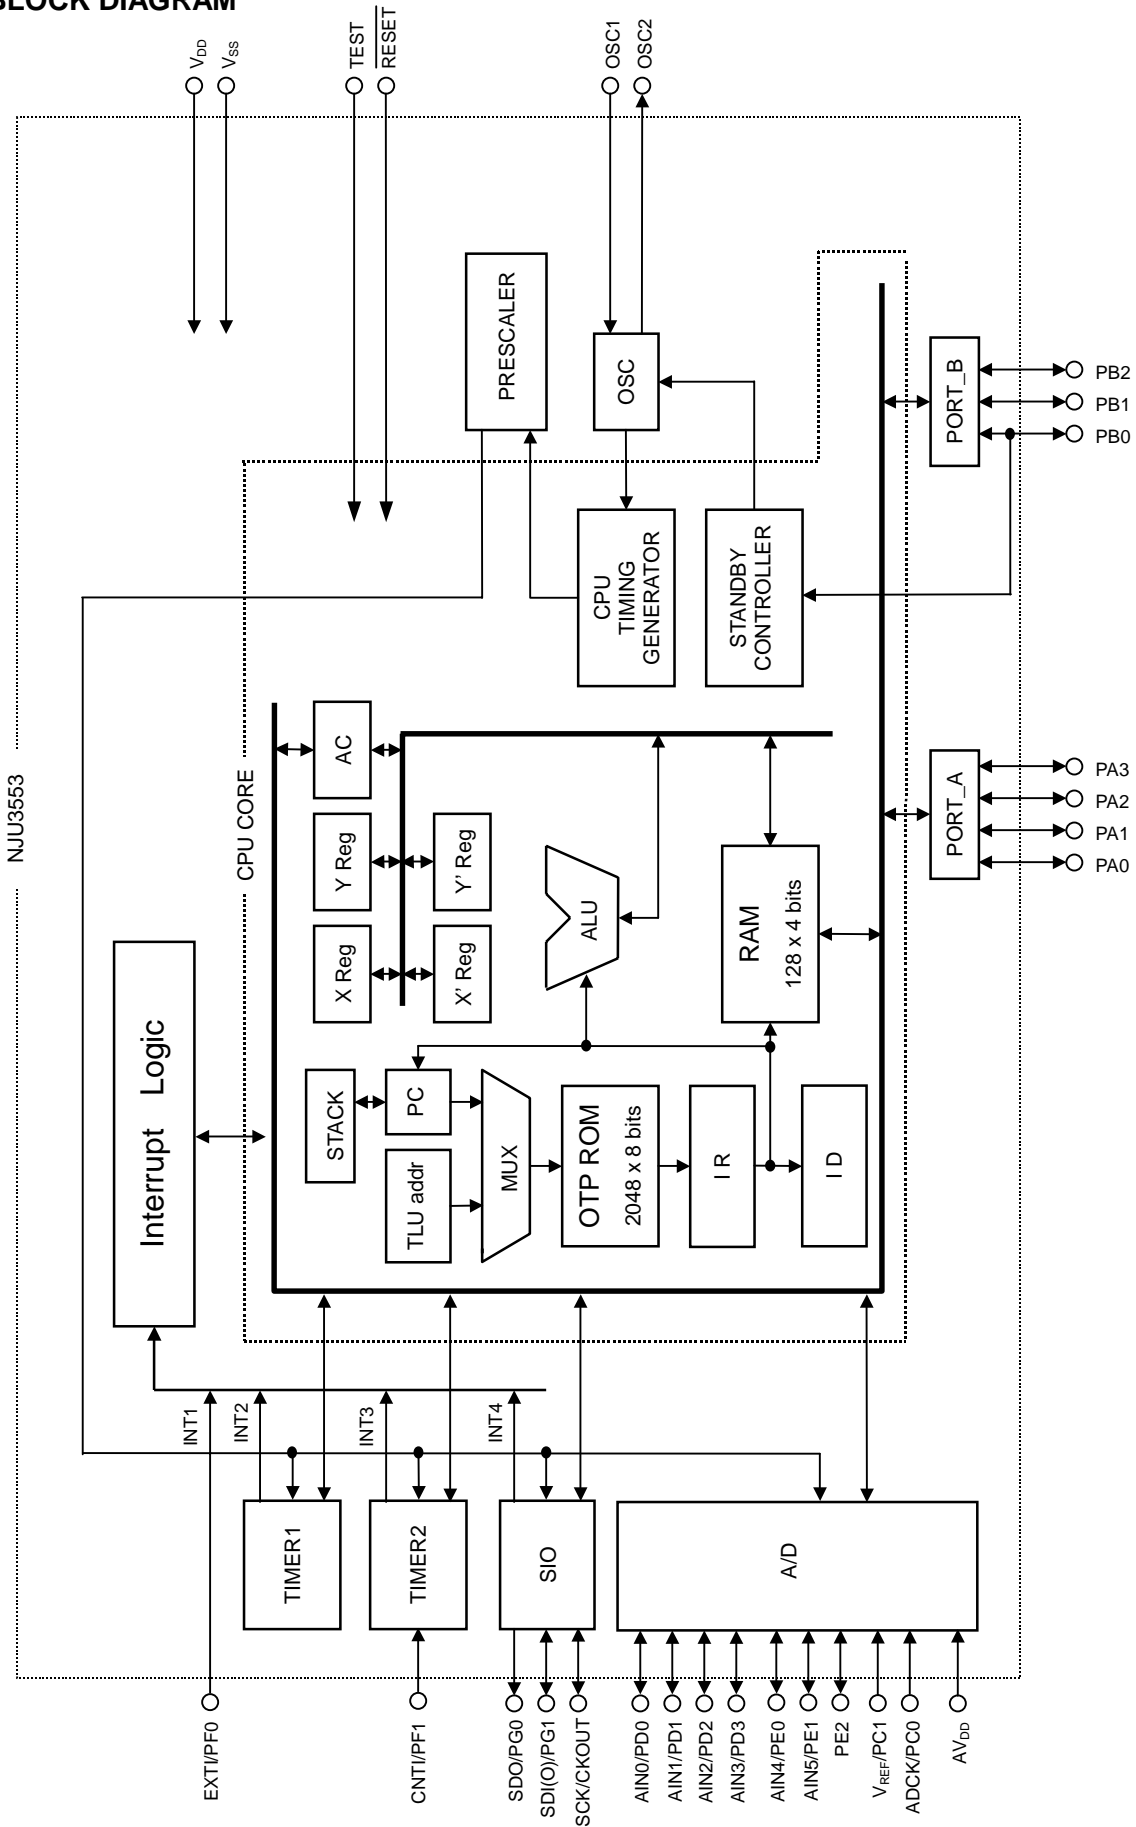

- Internal One Time Programmable ROM 2,048 X 8bits
- Internal Data RAM 128 X 4bits
- Wide operating voltage range 2.7V ~ 5.5V
- Package outline SDIP28 / SDMP30 (Compatible with **NJU3503**)
- ROM programmer "SUPERPRO/L" by XELTEK co.,.

■ PIN CONFIGURATION IN OTP PROGRAMMING MODE

Note) The pin configuration in Normal operating mode is the same as **NJU3503**.

■ TERMINAL DESCRIPTION IN OTP PROGRAMMING MODE

No.		SYMBOL	INPUT / OUTPUT	FUNCTION
NJU 3553L	NJU 3553M			
27	29	$\overline{\text{RESET}}$	INPUT	RESET terminal. When the low-level input-signal, the system is initialized.
24-26, 1-5	26-28, 1-3, 5, 6	D0 - D7	INPUT/OUTPUT	Data bus
7, 8	8, 9	CNT1 CNT2	INPUT INPUT	OTP control input terminal
16	17	REQ	OUTPUT	Request output terminal
15	16	CLK	INPUT	Clock input terminal
17	19	PROM	INPUT	OTP programming enable terminal
6, 28	7, 30	V _{DD}	-	Power Source (5V)
14	15	V _{SS}	-	Power Source (0V)

- Note 1) Use at V_{DD}=5V in OTP programming mode.
 2) Non connect anything to the other terminals.

■ Difference between NJU3553 (OTP version) and NJU3503 (MASK version)

● Operating mode

NJU3553 has two operating modes. One is "Normal operating mode" and the other is "OTP programming mode".

• Normal operating mode

The "TEST" terminal is set to low level. (The terminal is recommended to connect to GND.)
 Operating voltage range; 2.7V ~ 5.5V.

• OTP Programming mode

User program is read out from or written into the OTP by the universal programmer "SUPERPRO/L" and converting adapter made by XELTEK co.,(USA).

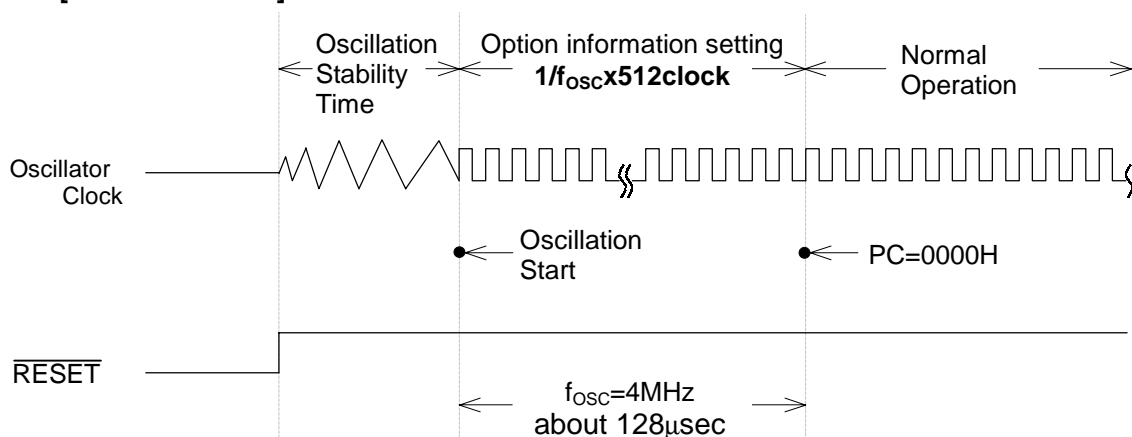

● Reset Terminal Type

	NJU3553	NJU3503
Internal Pull-up Resistance	With Pull-up	Without Pull-up

● Option information set in the initialization

When the initialization is performed($\overline{\text{RESET}}$ terminal is "L"), the operation information stored in option area is set as shown in the following timing chart. The option information is set in the term of $1 / f_{\text{osc}} \times 512\text{clock}$ after RESET releasing and oscillation stability time. After information set, the program counter is set to 0000H and the **NJU3553** operates in normal.

2) Re-start signal Input Selection

PB0 terminal performs as the re-start terminal to return from "STANDBY" mode. It is selected by mask option.

The STANDBY mode is released by the rising edge of the input signal to PB0 terminal, and the CPU re-starts the execution from the last address before the STANDBY mode in.

3) Edge Detector Selection

PB1 terminal is added the "Edge detect function" by the mask option.

4) External Interrupt of the edge Selection

When the interrupt function is set by mask option. PF0 terminal performs as the interrupt input terminal. The polarity of the edge, rising as "low to high" or falling as "high to low", is selected by the mask option.

5) The data order (MSB, LSB) of the Serial Interface

The data order of the Serial Interface is selected select either MSB or LSB first by the mask option.

6) A/D Control Clock

A/D Control Clock is selected either the external clock from ADCK terminal or the internal clock from the prescaler by the mask option.

7) Dividing ration of the internal clock

Each dividing ration of the count clocks of Timer1 and Timer2, the Internal shift clock of the Serial Interface, the clock of the A/D control clock and the output clock through the SCK/CKOUT terminal is selected among the following by the mask option.

The frequency of each clock is determined by the dividing ration and the 1-instruction term ($1/f_{OSC} \times 6$).

1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256, 1/512, 1/1024, 1/2048, 1/4096

Note) As Timer2 clock, the external clock or the internal is selected by the program.

As the shift clock of the serial interface, the external clock or the internal is selected by the program.
