

54ACT563

Octal Latch with TRI-STATE® Outputs

General Description

The 'ACT563 is a high-speed octal latch with buffered common Latch Enable (LE) and buffered common Output Enable $\overline{(OE)}$ inputs.

The 'ACT563 device is functionally identical to the 'ACT573, but with inverted outputs. $\label{eq:continuous}$

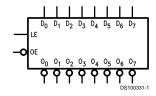

Features

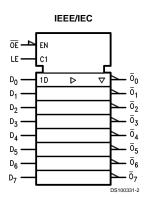

■ I_{CC} and I_{OZ} reduced by 50%

- Inputs and outputs on opposite sides of package allow easy interface with microprocessors
- Useful as input or output port for microprocessors
- Functionally identical to 'ACT573 but with inverted outputs
- Outputs source/sink 24 mA
- 'ACT563 has TTL-compatible inputs
- Standard Military Drawing (SMD)

Functional Description

The 'ACT563 contains eight D-type latches with TRI-STATE complementary outputs. When the Latch Enable (LE) input is HIGH, data on the D_n inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW the latches store the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The TRI-STATE buffers are controlled by the Output Enable $(\overline{\rm OE})$ input. When $\overline{\rm OE}$ is LOW, the buffers are in the bi-state mode. When $\overline{\rm OE}$ is HIGH the buffers are in the high impedance mode but that does not interfere with entering new data into the latches.

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. National does not recommend operation of FACTTW circuits outside databook specifications.
