

DS1776 PI-Bus Transceiver

General Description

The DS1776 is an octal PI-bus Transceiver. The A to B path is latched. B outputs are open collector with series Schottky diode, ensuring minimum B output loading. B outputs also have ramped rise and fall times (2.5 ns typical), ensuring minimum PI-bus ringing. B inputs have glitch rejection circuitry, 4 ns typical.

Designed using National's Bi-CMOS process for both low operating and disabled power. AC performance is optimized for the PI-Bus inter-operability requirements.

The DS1776 is an octal latched transceiver and is intended to provide the electrical interface to a high performance wired-or bus. This bus has a loaded characteristic impedance range of 20Ω to 50Ω and is terminated on each end with a 30Ω to 40Ω resistor.

The DS1776 is an octal bidirectional transceiver with open collector B and TRI-STATE® A port output drivers. A latch function is provided for the A port signals. The B port output

driver is designed to sink 100 mA from 2V and features a controlled linear ramp to minimize crosstalk and ringing on the bus.

A separate high level control voltage (V_X) is provided to prevent the A side output high level from exceeding future high density processor supply voltage levels. For 5V systems, V_X is tied to V_{CC} .

Features

- Mil-Std-883C qualified
- Similar to BTL
- Low power $I_{CCL} = 41$ mA max
- B output controlled ramp rate
- B input noise immunity, typically 4 ns
- Available in 28-pin DIP, Flatpak and CLCC
- Pin and function compatible with Signetics 54F776

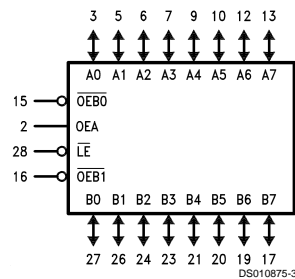

Pin Configurations

Order Number DS1776E/883 or DS1776J/883
See NS Package E28A or J28B

Logic Symbol

TRI-STATE® is a registered trademark of National Semiconductor Corporation.

DEVICE SPECIFICATIONS

Absolute Maximum Ratings (Notes 1, 2)

The 883 specifications are written to reflect the Rel Electrical Test Specifications (RETS) established by National Semiconductor for this product. For a copy of the latest RETS please contact your local National Semiconductor sales office or distributor.

Supply Voltage (V_{CC})	-0.5V to +7.0V
V_X , V_{OH} Output Level Control Voltage (A Outputs)	-0.5V to +7.0V
\overline{OEB} , n, OEA, \overline{LE} Input Voltage (V_i)	-0.5V to +7.0V
A0-A7, B0-B7 Input Voltage (V_i)	-0.5V to +5.5V
Input Current (I_i)	-40 mA to +5 mA
Voltage Applied to Output in High Output State (V_O)	-0.5V to + V_{CC} V
A0-A7 Current Applied to Output	

in Low Output State (I_O)	40 mA
B0-B7 Current Applied to Output in Low Output State (I_O)	200 mA
Storage Temperature Range (T_{STG})	-65°C to +150°C
Lead Temperature (Soldering 10 Sec.)	260°C
ESD Tolerance:	
$C_{ZAP} = 120$ pF, $R_{ZAP} = 1500\Omega$	0.5 kV

Operating Conditions

	Min	Max	Units
Supply Voltage (V_{CC})	4.5	5.5	V
Operating Temp. Range (T_A)	-55	+125	°C
Input Rise or Fall Times (t_r , t_f)		50	ns

PI Bus Transceiver DS1776

DC Electrical Characteristics

$V_{CC} = 5V \pm 10\%$ (Unless Otherwise Specified) DC testing temp. groups: 1 = +25°C, 2 = +125°C, 3 = -55°C

Symbol	Parameter		Conditions (Notes 3, 5)	Temp. Group	Min	Typ (Note 4)	Max	Units

Note 1: Absolute Maximum Ratings are those values beyond which damage to the device may occur.

Note 2: Unless otherwise specified all voltages are referenced to ground.

Note 3: For conditions shown as Min or Max, use the appropriate value specified under recommended operating conditions. Unless otherwise specified, $V_X = V_{CC}$ for all test conditions.

Note 4: All typical values are at $V_{CC} = 5V, T_A = 25^\circ\text{C}$.

Note 5: Due to test equipment limitations, actual test conditions are for $V_{IH} = 1.9V$ and for $V_{IL} = 1.2V$, however the specified test limits and conditions are guaranteed.

Note 6: Not more than one output should be shorted at a time. For testing I_{OS} the use of high speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter test I_{OS} test should be performed last.

Note 7: Not more than one output should be shorted at a time. For testing I_{OS} , the use of high speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter test, I_{OS} tests should be performed last.

L	X	L	L	X	H	L	Z	off	B off and A TRI-STATE
X	X	H	L	X	H	Qn	Z	off	
—	H	L	H	X	H	H	H	off	B off, Data from B to A
—	L	L	H	X	H	L	L	off	
—	H	H	H	X	H	Qn	H	off	
—	L	H	H	X	H	Qn	L	off	

H = High Voltage Level

L = Low Voltage Level

X = Don't Care

— = Input not externally driven

Z = High Impedance (off) state

Qn = High or Low voltage level one setup time prior to the Low-to-High \overline{LE} transition

Note 8: Condition will cause a feedback loop path; A to B and B to A.

Note 9: The latch must be preconditioned such that B inputs may assume a High or Low level while \overline{OEB} 0 and \overline{OEB} 1, are Low and \overline{LE} is high.

Note 10: Precaution should be taken to ensure that the B inputs do not float. If they do, they are equal to a Low state.

Note 11: off = Applies to "B" (OC) outputs only. Indicates that the outputs are turned off.

CONTROLLER POWER SEQUENCING OPERATION

The DS1776 has a design feature which controls the output transitions during power up (or down). There are two possible conditions that occur.

1. When \overline{LE} = Low and \overline{OEB} n = Low, the B outputs are disabled until the \overline{LE} circuit can take control. This feature ensures that the B outputs will follow the A inputs and allow only one transition during power up (or down).
2. If \overline{LE} = High or \overline{OEB} n = High, then the B outputs still remain disabled during power up (or down).

Switching Characteristics

AC WAVEFORMS

Waveform 1: Propagation Delay for Data to Output

Waveform 2: Propagation Delay for Data to Output

Waveform 3: TRI-STATE Output Enable Time to High Level and Output Disable Time from High Level

Waveform 4: TRI-STATE Output Enable Time to Low Level and Output Disable Time from Low Level

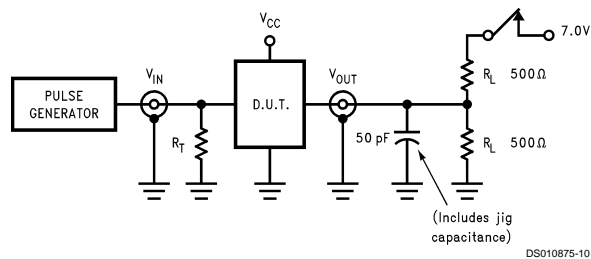

The shaded areas indicate when the input is permitted to change for predictable output performance.

Waveform 5: Data Setup and Hold Times and LE Pulse Widths

TEST CIRCUIT AND WAVEFORMS

Test Circuit for TRI-STATE Outputs on A Side

Switch Position

Test	Switch
t_{PLZ} , t_{PZL}	Closed
All Other	Open

Switching Characteristics (Continued)

Test Circuit for TRI-STATE Outputs on B Side

DEFINITIONS

R_L = Load resistor 500 Ω

C_L = Load capacitance includes jig and probe capacitance

R_T = Termination resistance should be equal to Z_{OUT} of pulse generators.

R_U = Pull up resistor

Input Pulse Definition

	Input Pulse Characteristics					
	Amplitude	Low V	Rep. Rate	t_w	t_{TLH}	t_{THL}
A Side	3.0V	0.0V	1 MHz	500 ns	2 ns	2 ns
B Side	2.0V	1.0V	1 MHz	500 ns	2 ns	2 ns

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
