

MSM6882-3/6882-5**2400/1200 bps Single Chip MSK Modem****GENERAL DESCRIPTION**

The MSM6882-3/6882-5 is a single chip MSK (Minimum Shift Keying) modem which is fabricated by Okí's low power consumption CMOS silicon gate technology.

The demodulator receives the data to be transmitted (SD) synchronized with the transmit timing clock (ST) generated by the on-chip clock generator. The signal, which is modulated by MSK method, is output.

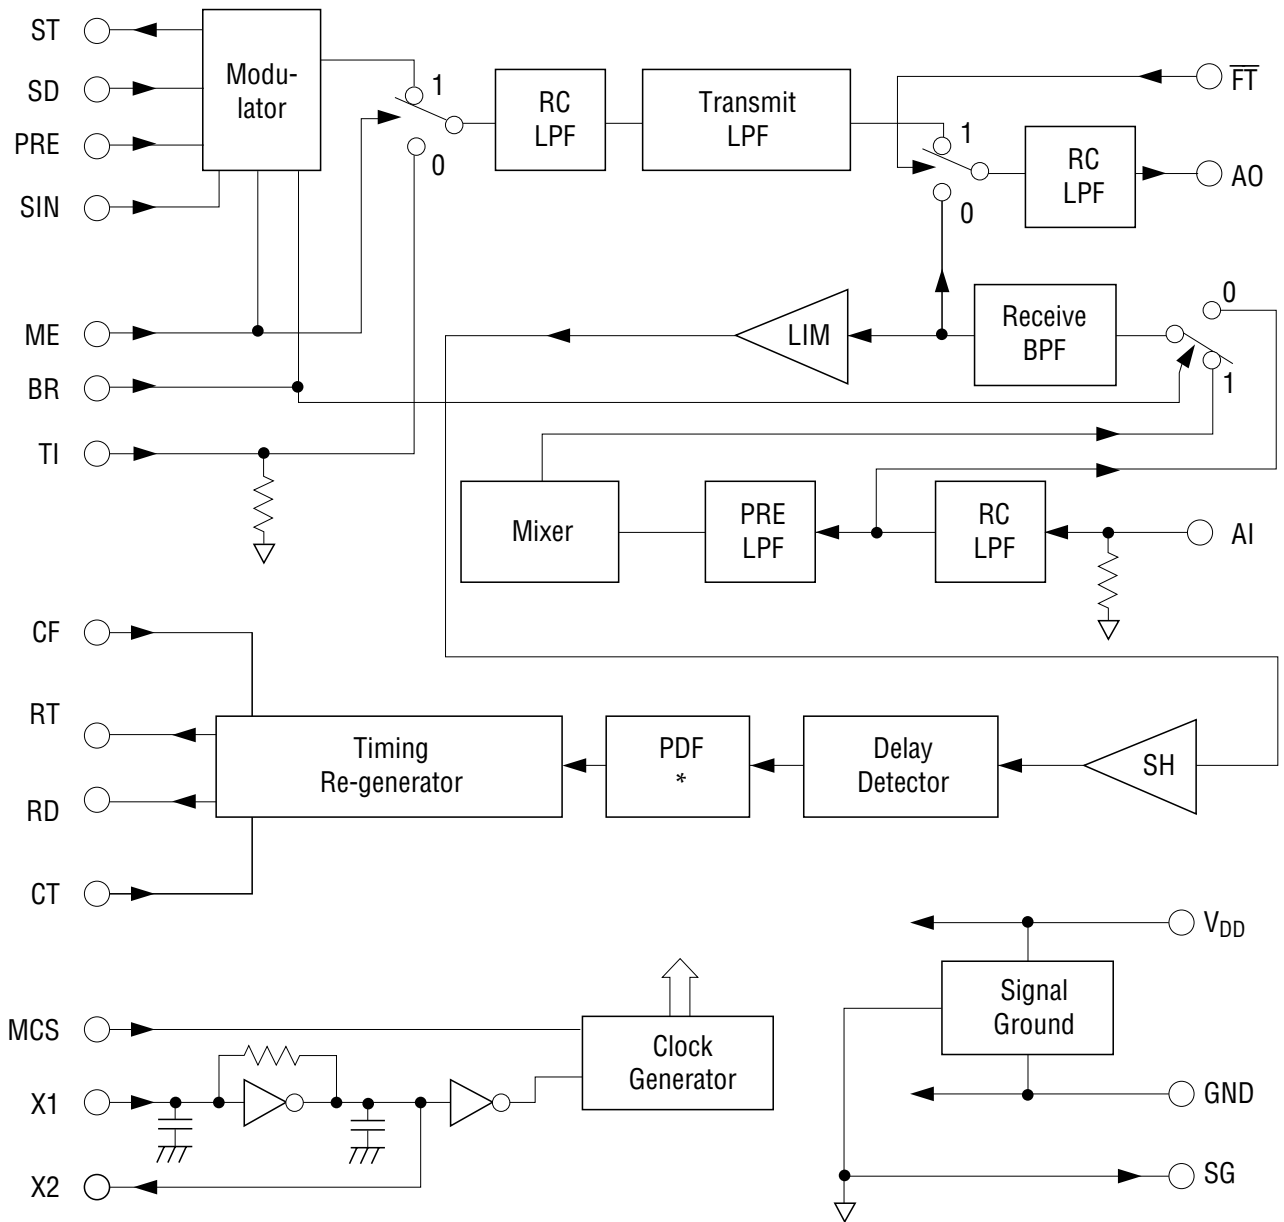

The demodulator converts the received MSK signal to the received data (RD) by means of a delay detection technique after limiting the band of the received MSK signal. This signal is input to the digital PLL and the re-generated timing clock (RT) is output from the demodulator, synchronized with the RD.

FEATURES

- Signal power supply: +3.6 V (MSM6882-3)
+5 V (MSM6882-5)
- On-chip SCF (Switched Capacitor Filter)
- The transmit filter can be also used as voice splatter filter.
- The receive timing re-generator has two different lock-in time performance options to be chosen from.
- Bit rate 2400/1200 bps
- CCIR Rec. 623
- The modulation method can be selected from COS-FFSK and SIN-FFSK.
- Built-in crystal oscillation circuit.
- Package options:

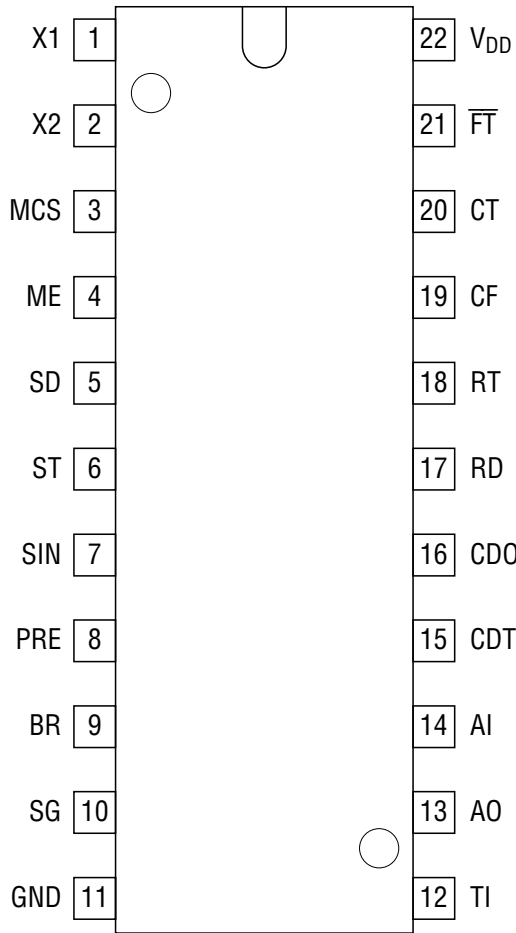

22-pin plastic DIP	(DIP22-P-400-2.54)	(Product name: MSM6882-3RS)
		(Product name: MSM6882-5RS)
24-pin plastic SOP	(SOP24-P-430-1.27-K)	(Product name: MSM6882-3GS-K)
		(Product name: MSM6882-5GS-K)

NC : No connect pin

PIN DESCRIPTION

Name	Description																					
X1	Crystal connection pins. A 3.6864 MHz or 7.3728 MHz crystal shall be connected.																					
X2	When an external clock is applied for MSM6882's oscillation source, it has to be input to X2. In this case, X2 has to be AC-coupled by the capacitor of 200 pF. X1 shall be left open.																					
MCS	Master clock selection. <table border="1" data-bbox="402 524 799 656"> <thead> <tr> <th>MCS</th> <th>Crystal or External Clock</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>3.6864 MHz</td> </tr> <tr> <td>1</td> <td>7.3728 MHz</td> </tr> </tbody> </table>	MCS	Crystal or External Clock	0	3.6864 MHz	1	7.3728 MHz															
MCS	Crystal or External Clock																					
0	3.6864 MHz																					
1	7.3728 MHz																					
ME	Modulator enable. When a "high" is input on this pin, MSK modulator output is connected to the input of transmit LPF. When a "low" is input on this pin, TI is connected to the input of transmit LPF.																					
SD	Send data input. The data on this pin is synchronized with the rising edge of ST and input to MSK modulator as an actual transmit data. 																					
ST	This timing signal is used to latch serial input data on the SD pin. The frequency of ST coincides with the transmission bit rate.																					
SIN	Modulation method selection. Data put on this pin selects either SINE FAST FSK or COSINE FAST FSK. <table border="1" data-bbox="461 1319 1141 1507"> <thead> <tr> <th>Data (2400 bps)</th> <th>0</th> <th>1</th> <th>0</th> <th>0</th> <th>1</th> <th>1</th> </tr> </thead> <tbody> <tr> <td>Sine Fast FSK</td> <td></td> <td></td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>Cosine Fast FSK</td> <td></td> <td></td> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	Data (2400 bps)	0	1	0	0	1	1	Sine Fast FSK							Cosine Fast FSK						
Data (2400 bps)	0	1	0	0	1	1																
Sine Fast FSK																						
Cosine Fast FSK																						
PRE	Preamble or data transmission selection. When a "low" is input on this pin, the data put on the SD pin is output on the AO pin. When a "high" is input on this pin, the data put on the SD pin is neglected and preamble data is output. Data put on PRE is latched on the rising edge of ST. Preamble means to modulate as 010101...pattern.																					

Name	Description																																				
BR	Baud rate selection. <table border="1" data-bbox="427 376 1270 680"> <thead> <tr> <th rowspan="2">Master Clock (MHz)</th> <th rowspan="2">MCS</th> <th rowspan="2">BR</th> <th rowspan="2">Bit Rate (bps)</th> <th colspan="2">Carrier Freq. SG	Built-in analog signal ground. The DC voltage is approximately half of V_{DD} , so the analog interfaces signals of AI, AO, and TI with peripheral circuits which must be implemented by AC-coupling. To make this voltage source impedance lower and ensure the device performance of this device, more than 0.1 μF bypass capacitors should be connected from SG to GND and from SG to V_{DD} .																																				
GND	Ground. (0 V)																																				
TI	Voice signal input. The signal input to this pin can be sent out to AO through the transmit LPF, the characteristics of which, gives the splatter filter for voice band signal. When this function is used, digital "0" must be input to ME. TI is biased to SG through internal resistor.																																				
AO	Transmit analog signal output. The data put on ME and $\overline{\text{FT}}$ can set the status of AO as follows. <table border="1" data-bbox="411 1232 1308 1451"> <thead> <tr> <th>$\overline{\text{FT}}$</th> <th>ME</th> <th>Transmit LPF</th> <th>State of AO</th> </tr> </thead> <tbody> <tr> <td>"1"</td> <td>"1"</td> <td rowspan="2">Power On</td> <td>MSK Signal</td> </tr> <tr> <td>"1"</td> <td>"0"</td> <td>Voice Signal</td> </tr> <tr> <td>"0"</td> <td>"1"</td> <td rowspan="2">Power Down</td> <td>The Output of Receive BPF</td> </tr> <tr> <td>"0"</td> <td>"0"</td> <td>No-signal (SG level)</td> </tr> </tbody> </table>	$\overline{\text{FT}}$	ME	Transmit LPF	State of AO	"1"	"1"	Power On	MSK Signal	"1"	"0"	Voice Signal	"0"	"1"	Power Down	The Output of Receive BPF	"0"	"0"	No-signal (SG level)																		
	$\overline{\text{FT}}$	ME	Transmit LPF	State of AO																																	
"1"	"1"	Power On	MSK Signal																																		
"1"	"0"		Voice Signal																																		
"0"	"1"	Power Down	The Output of Receive BPF																																		
"0"	"0"		No-signal (SG level)																																		
 <p>The diagram shows the internal circuitry for the AO pin. It includes a TI pin, a Modulator (SD), a Transmit LPF, a Receive BPF, and an op-amp. The AO pin is connected to the op-amp output. The AI pin is connected to the input of the Receive BPF. The diagram illustrates the 'Power down' state where AO is connected to SG.</p>																																					
<p>The state when $\overline{\text{FT}}$ and ME = "0" is shown above. When the input digital data on $\overline{\text{FT}}$ changes to "1" from "0", AO remains to be connected to SG during about 2 ms and after that, and AO is switched to transmit LPF. This delay time prevents AO from outputting meaningless signal during transient time from power down to on of LPF.</p>																																					

Name	Description																	
AI	Receive analog signal input. AI is biased internally to SG with about 100 kΩ same as TI.																	
CDT	Device test. This pin should be connected to GND.																	
CDO	Device test. This pin should be opened.																	
RD	Demodulated serial data output. This data is synchronized with the re-generated timing clock RT.																	
RT	<p>Receive data timing clock output. This signal is re-generated by internal digital PLL. Synchronizing to negative edge of RT, RD is output.</p> 																	
CF	<p>Receive data timing clock is re-generated by digital PLL of which phase correcting speed can be selected with CF. When a digital "1" is put on CF and phase difference between receive data timing and RT is more than 22.5 degree, phase correcting speed is high. In this case, as the phase difference enters within 22.5 degrees, that speed changes to low immediately. When digital "0" is input to CF, phase correcting speed of PLL remains low regardless of the phase difference. Usually, CF is connected to digital "1".</p>																	
CT	<p>PLL's lock-in characteristics can be selected with CT. When digital "1" is put on CT, PLL requires max. 50 bit alternative data pattern. On the other hand, when digital "0" is input to CT, PLL can be locked in below 18-bit data.</p> <table border="1" data-bbox="413 1361 1059 1496"> <thead> <tr> <th>CF</th> <th>CT</th> <th>MIN</th> <th>TYP</th> <th>MAX</th> <th>UNIT</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0</td> <td>—</td> <td>—</td> <td>18</td> <td rowspan="2">bit</td> </tr> <tr> <td>1</td> <td>1</td> <td>—</td> <td>—</td> <td>50</td> </tr> </tbody> </table>	CF	CT	MIN	TYP	MAX	UNIT	1	0	—	—	18	bit	1	1	—	—	50
CF	CT	MIN	TYP	MAX	UNIT													
1	0	—	—	18	bit													
1	1	—	—	50														
\overline{FT}	<p>Control signal for the internal connection of AO. Refer to column AO. When digital "0" is input to this pin, transmit LPF enters in power down mode, but the output buffer operational amplifier remains active. In this case, AO is at SG level.</p>																	
V _{DD}	<p>Power supply. MSM6882-3: 3.6 V MSM6882-5: 5 V This device is sensitive to supply noise as switched capacitor techniques are utilized. A bypass capacitor of more than 2.2 μF between V_{DD} and GND is indispensable to ensure the performance.</p>

BUILT-IN FILTER FREQUENCY CHARACTERISTICS

Note: When BR = "1", frequency converter circuit (MIXER) is prepared before the receive BPF. Therefore, 1200 Hz input signal is converted to 3600 Hz at BPF output for example.

APPLICATION CIRCUIT

PACKAGE DIMENSIONS

(Unit : mm)

(Unit : mm)

Notes for Mounting the Surface Mount Type Package

The SOP, QFP, TSOP, SOJ, QFJ (PLCC), SHP and BGA are surface mount type packages, which are very susceptible to heat in reflow mounting and humidity absorbed in storage. Therefore, before you perform reflow mounting, contact Oki's responsible sales person for the product name, package name, pin number, package code and desired mounting conditions (reflow method, temperature and times).
