

**MSM7590L-01****Multi-Function ADPCM CODEC****GENERAL DESCRIPTION**

The MSM7590L-01, developed for advanced digital cordless telephone systems, is a single channel ADPCM CODEC IC which performs mutual transcoding between the analog voice band signal and 32 kbps ADPCM serial data.

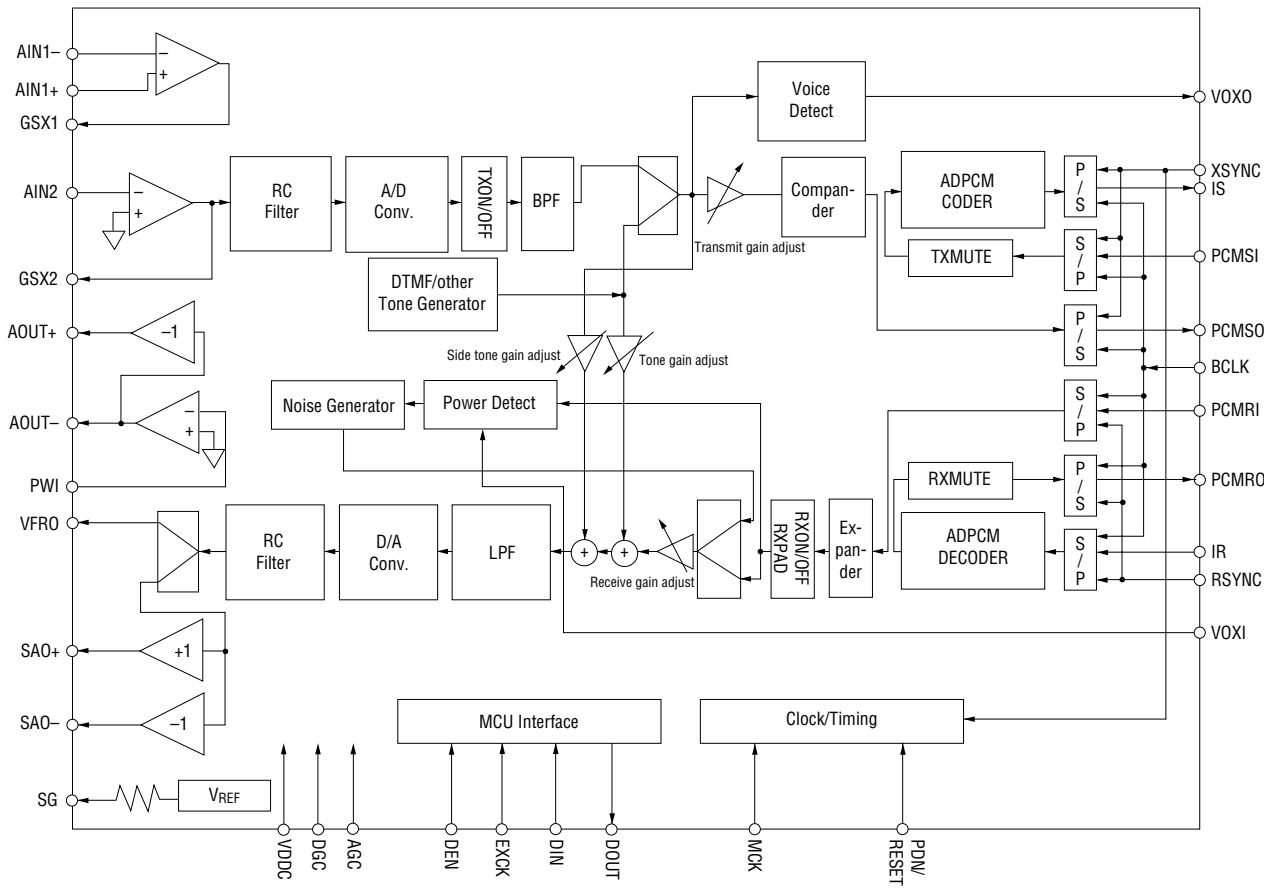

This device includes DTMF Tone and several types of tone generation, transmit/receive data mute and gain control, side-tone path and gain control, and VOX function.

Using advanced circuit technology, the device operates from a single 3 V power supply and provide low power consumption.

**FEATURES**

- Single 3 V Power Supply Operation V<sub>DD</sub>: 2.7 V to 3.6 V
- ADPCM Algorithm : ITU-T G.726 (32 kbps, 24 kbps, 16 kbps)
- Full-Duplex Transmit/Receive Operation
- Transmit/Receive Synchronous Mode Only
- PCM Data Format : A-law or  $\mu$ -law Selectable
- Serial PCM/ADPCM Transmission Data Rate : 64 kbps to 2048 kbps
- Low Power Consumption
  - Operating Mode : 21 mW Typ. (V<sub>DD</sub> = 3.0 V)
  - Power-Down Mode : 0.3 mW Typ. (V<sub>DD</sub> = 3.0 V)
- Two Analog Input Amplifier Stages : Externally Adjustable Gain
- Analog Output Stage : Push-pull Drive (direct drive of 350  $\Omega$  + 120 nF)
- Master Clock Frequency : 10.368 MHz
- Transmit/Receive Mute, Transmit/Receive Programmable Gain Control
- Side Tone Path with Programmable Attenuation (8-step Adjustment Level)
- Built-in DTMF Tone Generator
- Built-in Various Ringing/Function Tones Generator
- Built-in Various Ring Back Tone Generator
- Serial MCU Interface Control
- Built-in Sounder Driving Amplifier
- Built-in VOX Control
  - Transmit side : Voice Signal Detect
  - Receive side : Background Noise Generation
- Characteristic Evaluation Board.
- Package:
  - 32-pin plastic TSOP (TSOPI32-P-814-0.50-1K) (Product name: MSM7590L-01TS-K)

**PIN CONFIGURATION (TOP VIEW)**

**32-Pin Plastic TSOP**

**PIN AND FUNCTIONAL DESCRIPTIONS**

**AIN1+, AIN1-, AIN2, GSX1, GSX2**

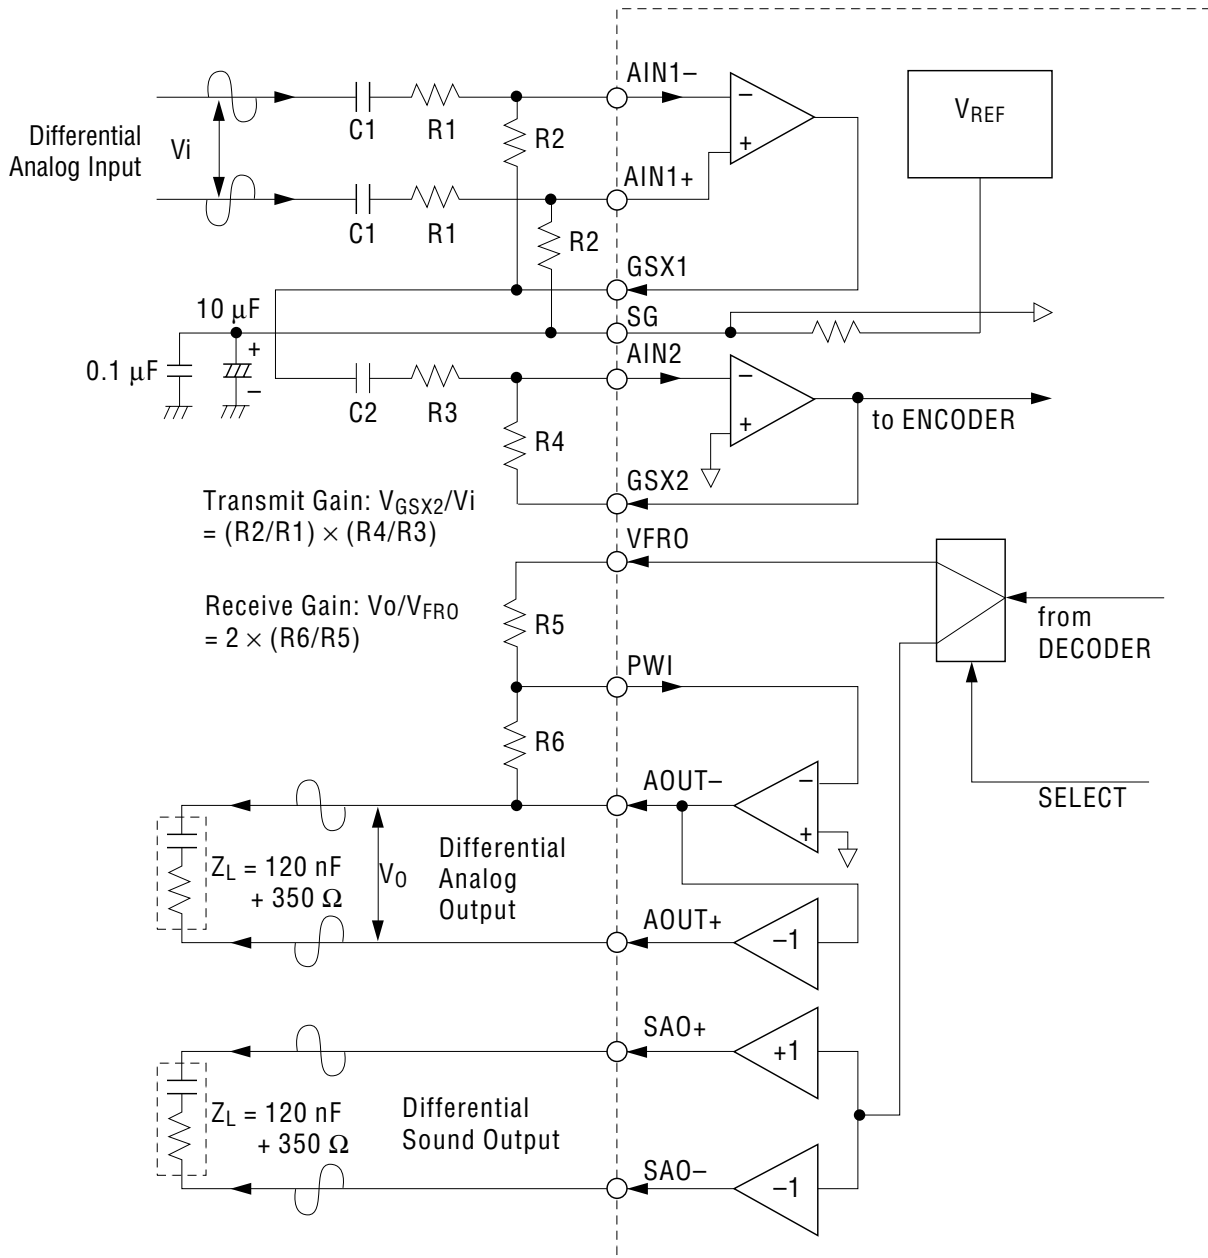

Transmit analog inputs and the output for transmit gain adjustment.

AIN1- (AIN2) connects to inverting input of the internal transmit amplifier. AIN1+ connects to non-inverting input of the internal transmit amplifier. GSX1 (GSX2) connects to the internal transmit amplifier output. Refer to Fig.1 for gain adjustment.

**VFRO, AOUT+, AOUT-, PWI**

Receive analog outputs and the output for receive gain adjustment.

VFRO is the receive filter output. AOUT+ and AOUT- are differential analog signal outputs which can directly drive  $Z_L = 350 \Omega + 120 \text{ nF}$  or a 1.2 k $\Omega$  load. Refer to Fig.1 for gain adjustment.

**Figure 1 Analog Input/Output Interface**

**SAO+, SAO-**

Differential analog outputs for sound output.

Control register data CR4-B5 determines the output pins (AOUT+ and AOUT- /SAO+ and SAO-) for the voice signal and an acoustic component of the sound tone, DTMF tone, R tone, F tone, and various types of tones at either the VFRO pin or the SAO+ and SAO- pins. The output load conditions of these pins are the same as those of AOUT+ and AOUT-.

**SG**

Analog signal ground.

The output voltage of this pin is approximately 1.4 V. Put the bypass capacitors (10  $\mu$ F in parallel with 0.1  $\mu$ F ceramic type) between this pin and AG to get the specified noise characteristics. During power-down, this output voltage is 0 V. The SG voltage if necessary, should be via a buffer.

**AG**

Analog ground.

**DG**

Digital ground.

This ground is separated from the analog signal ground pin (AG). The DG pin must be kept as close as possible to AG on the PCB.

**V<sub>DD</sub>**

+3 V power supply.

**PDN/RESET**

Power down and reset control input.

A "0" level makes the IC enter a power down state. At the same time, all control register data are reset to the initial state. Set this pin to "1" during normal operating mode. The power down state is controlled by a logical OR with CR0-B5 of the control register. When using PDN/RESET for power down and reset control, set CR0-B5 to digital "0". The reset width (during "L") is 200 ns or more.

**MCK**

Master clock input.

The frequency must be 10.368 MHz. The master clock signal may be asynchronous with BCLK, XSYNC, and RSYNC.

**PCMSO**

Transmit PCM data output.

PCM is output from MSB in synchronization with the rising edge of BCLK and XSYNC.

**PCMSI**

Transmit PCM data input.

This signal is converted to the transmit ADPCM data. PCM is shifted in synchronization with the falling edge of BCLK. Normally, this pin is connected to PCMSO.

**PCMRO**

Receive PCM data output.

PCM is the output signal after ADPCM decoder processing. This signal is output serially from MSB in synchronization with the rising edge and BCLK and RSYNC.

**PCMRI**

Receive PCM data input.

PCM is shifted on the rising edge of the BCLK and input from MSB. Normally, this pin is connected to PCMRO.

**IS**

Transmit ADPCM signal output.

After having encoded PCM with ADPCM, this signal is output from MSB in synchronization with the rising edge of BCLK and XSYNC. This pin is an open drain output and remains in a high impedance state during power-down. IS requires a pull-up resistor.

**IR**

Receive ADPCM signal input.

This input signal is shifted serially on the falling edge of BCLK in synchronization with RSYNC and input from MSB.

**BCLK**

Shift clock input for the PCM data (PCMSO, PCMSI, PCMRO, PCMRI) and the ADPCM data (IS, IR).

The frequency is set in the range of 64 kHz to 2048 kHz.

**XSYNC**

Transmit PCM and ADPCM data 8 kHz synchronous signal input.

Synchronize this signal with BCLK signal. XSYNC is used to indicate the MSB of the transmit serial PCM and ADPCM data stream.

Be sure to input the XSYNC signal because it is also used as the input of the timing generator.

**RSYNC**

Receive PCM and ADPCM data synchronous signal input.

Synchronize this signal with BCLK signal. RSYNC is used to indicate the MSB of the receive serial PCM and ADPCM data stream.

**VOXO**

Transmit VOX function signal output.

VOX function recognizes the presence or absence of the transmit voice signal by detecting the signal energy. "1" and "0" levels set on this pin correspond to the presence and the absence of voice, respectively. This result appears at the register data CR7-B7. The signal energy detect threshold is set by the control register data CR6-B6, B5.

**VOXI**

Signal input for receive VOX function.

A "1" level at VOXI indicates the presence of a voice signal. The decoder block processes normal receive signal, and the voice signal appears at the analog output pins. The "0" level indicates the absence of a voice signal. Background noise generated in this device is transferred to the analog output pins. The background noise amplitude is set by the control register CR6. Because this signal is ORed with the register data CR6-B3, set the control register data CR6-B3 to digital "0".

(a) Transmit VOX Function Timing Diagram

(b) Receive VOX Function (CR6-B3: digital "0") Timing Diagram

Note: VOXO, VOXI functions become valid when setting CR6-B7 to digital "1".

Figure 2 VOX Function

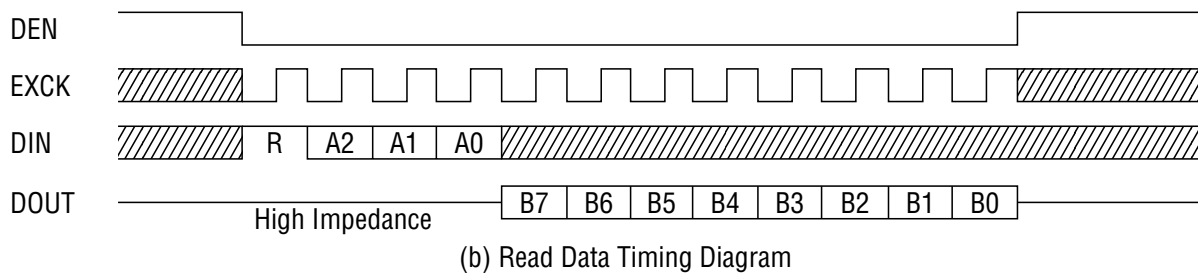

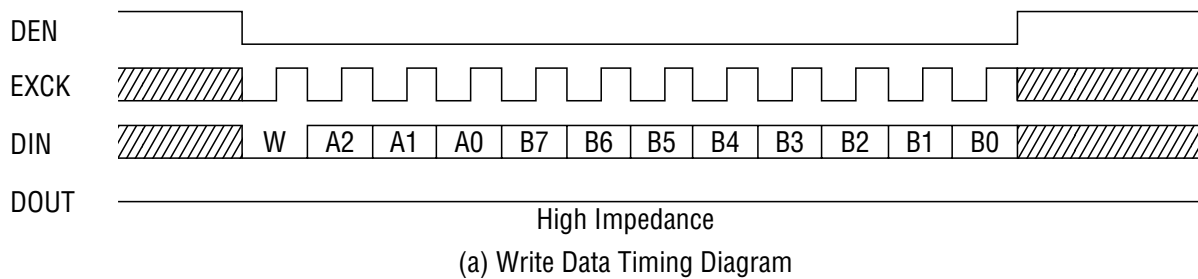

**DEN , EXCK, DIN, DOUT**

Serial control ports for MCU interface.

Reading and writing data are performed by an external MCU through these pins. Eight registers with eight bits are provided on the devices.

DEN is the “Enable” control signal input, EXCK is the data shift clock input, DIN is the address and data input, and DOUT is the data output.

Fig.3 shows the input/output timing diagram.

The transmitter and receiver cannot be reset separately.  
They must be reset at the same time.

(3) CR2 (PCM CODEC operational mode setting and transmit/receive gain adjustment)

1	1	1	+8 dB	1	1	1	+8 dB

This programmable gain table, not only for transmit/receive voice signal and the transmitted DTMF and other tones. The transmission of these tone signals is enabled by the CR4-B6 data described later. The original (reference) signal amplitude of these tones is analogically defined as follows.

DTMF low-group-tones ..... -16 dBm0  
 DTMF high-group-tones and others ..... -14 dBm0

For example, when selecting +8 dB (B6, B5, B4) = (1,1,1) as a transmit gain, each tone signal amplitude with an analogical expression on the pin PCMSO becomes as follows .

DTMF low-group tones ..... -8 dBm0  
 DTMF high-group tones and other tones ..... -6 dBm0

Gain setting for the side tone (path to receive side from transmit side) and the receive side tone is performed by register CR3.

(4) CR3 (Side tone and other tone generator gain setting)

0	1	1	0	-24 dB	1	1	1	0	-8 dB
0	1	1	1	-22 dB	1	1	1	1	-6 dB

The tone generator gain setting table for the receive side, as shown in Table-4, depends upon the following reference level.

DTMF low-group tones ..... -2 dBm0

DTMF high-group tones and others ..... 0 dBm0

For example, when selecting -6 dB (B3, B2, B1, B0) = (1, 1, 1, 1) as a tone generator gain, each DTMF tone signal amplitude on SAO+/SAO- or VFRO is as follows.

DTMF low-group tone ..... -8 dBm0

DTMF high-group tone or other tones ..... -6 dBm0

Notes for Mounting the Surface Mount Type Package

The SOP, QFP, TSOP, SOJ, QFJ (PLCC), SHP and BGA are surface mount type packages, which are very susceptible to heat in reflow mounting and humidity absorbed in storage. Therefore, before you perform reflow mounting, contact Oki's responsible sales person for the product name, package name, pin number, package code and desired mounting conditions (reflow method, temperature and times).
