## MC14562B

## 128-Bit Static Shift Register

The MC14562B is a 128-bit static shift register constructed with MOS P-channel and N -channel enhancement mode devices in a single monolithic structure. Data is clocked in and out of the shift register on the positive edge of the clock input. Data outputs are available every 16 bits, from 16 through bit 128 . This complementary MOS shift register is primarily used where low power dissipation and/or high noise immunity is desired.

- Diode Protection on All Inputs
- Fully Static Operation
- Cascadable to Provide Longer Shift Register Lengths
- Supply Voltage Range = 3.0 Vdc to 18 Vdc
- Capable of Driving Two Low-power TTL Loads or One Low-power Schottky TTL Load Over the Rated Temperature Range

MAXIMUM RATINGS (Voltages Referenced to $\mathrm{V}_{\text {SS }}$ ) (Note 1.)

| Symbol | Parameter | Value | Unit |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {DD }}$ | DC Supply Voltage Range | -0.5 to +18.0 | V |
| $\mathrm{~V}_{\text {in }}, \mathrm{V}_{\text {out }}$ | Input or Output Voltage Range <br> (DC or Transient) | -0.5 to $\mathrm{V}_{\mathrm{DD}}+0.5$ | V |
| $\mathrm{I}_{\text {in }}, \mathrm{I}_{\text {out }}$ | Input or Output Current <br> (DC or Transient) per Pin | $\pm 10$ | mA |
| $\mathrm{P}_{\mathrm{D}}$ | Power Dissipation, <br> per Package (Note 2.) | 500 | mW |
| $\mathrm{~T}_{\mathrm{A}}$ | Ambient Temperature Range | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage Temperature Range | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{L}}$ | Lead Temperature <br> (8-Second Soldering) | ${ }^{\circ} \mathrm{C}$ |  |

1. Maximum Ratings are those values beyond which damage to the device may occur.
2. Temperature Derating:

Plastic "P and D/DW" Packages: $-7.0 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ From $65^{\circ} \mathrm{C}$ To $125^{\circ} \mathrm{C}$
This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, $\mathrm{V}_{\text {in }}$ and $\mathrm{V}_{\text {out }}$ should be constrained to the range $\mathrm{V}_{\mathrm{SS}} \leq\left(\mathrm{V}_{\text {in }}\right.$ or $\left.\mathrm{V}_{\text {out }}\right) \leq \mathrm{V}_{\mathrm{DD}}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ ). Unused outputs must be left open.
