

1:5 Clock Distribution Chip

The MC100LVEL/100EL14 is a low skew 1:5 clock distribution chip designed explicitly for low skew clock distribution applications. The device can be driven by either a differential or single-ended ECL or, if positive power supplies are used, PECL input signal. The LVEL14 is functionally and pin compatible with the EL14 but is designed to operate in ECL or PECL mode for a voltage supply range of $-3.0V$ to $-3.8V$ (or $3.0V$ to $3.8V$). If a single-ended input is to be used the $\overline{V_{BB}}$ output should be connected to the \overline{CLK} input and bypassed to ground via a $0.01\mu F$ capacitor. The $\overline{V_{BB}}$ output is designed to act as the switching reference for the input of the LVEL14 under single-ended input conditions, as a result this pin can only source/sink up to $0.5mA$ of current.

The LVEL14 features a multiplexed clock input to allow for the distribution of a lower speed scan or test clock along with the high speed system clock. When LOW (or left open and pulled LOW by the input pulldown resistor) the SEL pin will select the differential clock input.

The common enable (\overline{EN}) is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control. The internal flip flop is clocked on the falling edge of the input clock, therefore all associated specification limits are referenced to the negative edge of the clock input.

- 50ps Output-to-Output Skew
- Synchronous Enable/Disable
- Multiplexed Clock Input
- $75k\Omega$ Internal Input Pulldown Resistors
- $>2000V$ ESD Protection
- V_{EE} Range of $-3.0V$ to $-5.5V$

1. This table replaces the three tables traditionally seen in ECL 100K data books. The same DC parameter values at V_{EE} = -4.5V now apply across the full V_{EE} range of -3.0V to -5.5V. Outputs are terminated through a 50Ω resistor to -2.0V except where otherwise specified on the individual data sheets.

1. Skews are specified for identical LOW-to-HIGH or HIGH-to-LOW transitions.

2. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{ppmin} and 1V. The lower end of the CMR range varies 1:1 with V_{EE} . The numbers in the spec table assume a nominal $V_{EE} = -3.3V$. Note for PECL operation, the $V_{CMR(min)}$ will be fixed at $3.3V - |V_{CMR(min)}|$.
