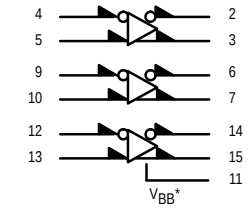
NOTES:
1. When V_{BB} is used as the reference voltage.
2. Each MECL 10H series circuit has been designed to meet the specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50–ohm resistor to –2.0 volts.
3. Differential input not to exceed 1.0 Vdc.
4. 150 mV_{p-p} differential input required to obtain full logic swing on output.

LOGIC DIAGRAM



V_{CC1} = Pin 1
V_{CC2} = Pin 16
V_{EE} = Pin 8

When input pin with bubble goes positive it's respective output pin with bubble goes positive.

*V_{BB} to be used to supply bias to the MC10H116 only and bypassed (when used) with 0.01 µF to 0.1 µF capacitor to ground (0 V). V_{BB} can source < 1.0 mA.

The MC10H116 is designed to be used in sensing differential signals over long lines. The bias supply (V_{BB}) is made available to make the device useful as a Schmitt trigger, or in other applications where a stable reference voltage is necessary.

Active current sources provide these receivers with excellent common–mode noise rejection. If any amplifier in a package is not used, one input of that amplifier must be connected to V_{BB} to prevent unbalancing the current–source bias network.

The MC10H116 does not have internal–input pull-down resistors. This provides high impedance to the amplifier input and facilitates differential connections.

Applications:
- Low Level Receiver
- Schmitt Trigger
- Voltage Level Interface
