

Features

- High-speed access times
 - Com'l: 7, 8, 10, 12 and 15ns
 - Ind'l: 8, 10, 12 and 15ns
 - (use 15ns for slower designs)
- Low power operation (typical)
 - PDM41256SA
 - Active: 475 mW
 - Standby: 100 mW
 - PDM41256LA
 - Active: 425mW
 - Standby: 25 mW
- Single +5V ($\pm 10\%$) power supply
- TTL-compatible inputs and outputs
- Packages
 - Plastic SOJ (300 mil) - SO
 - Plastic TSOP (I) - T

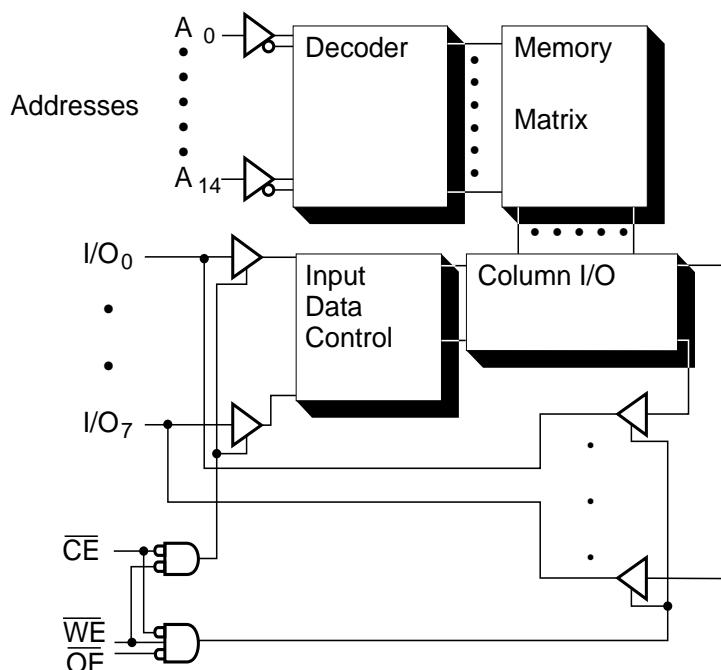

Description

The PDM41256 is a high-performance CMOS static RAM organized as 32,768 x 8 bits. Writing to this device is accomplished when the write enable (\overline{WE}) and the chip enable (\overline{CE}) inputs are both LOW. Reading is accomplished when \overline{WE} remains HIGH and \overline{CE} and \overline{OE} are both LOW.

The PDM41256 operates from a single +5V power supply and all the inputs and outputs are fully TTL-compatible. The PDM41256 comes in two versions: the standard power version PDM41256SA and the low power version PDM41256LA. Both versions are functionally the same and differ only in their power consumption.

The PDM41256 is available in a 28-pin plastic TSOP (I) and a 28-pin 300-mil plastic SOJ.

T _j	Maximum Junction Temperature (2)	125	145	°C

- NOTE: 1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Appropriate thermal calculations should be performed in all cases and specifically for those where the chosen package has a large thermal resistance (e.g., TSOP). The calculation should be of the form: T_j = T_a + P * θ_{ja} where T_a is the ambient temperature, P is average operating power and θ_{ja} the thermal resistance of the package. For this product, use the following θ_{ja} values:

SOJ: 78 °C/W

TSOP: 112 °C/W

NOTES: (For three previous Electrical Characteristics tables)

1. The device is continuously selected. Chip Enable is held in its active state.
2. The address is valid prior to or coincident with the latest occurring Chip Enable.
3. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} .
4. This parameter is sampled.
5. The parameter is tested with $CL = 5 \text{ pF}$ as shown in Figure 2. Transition is measured $\pm 200 \text{ mV}$ from steady state voltage
6. $V_{CC} = 5V \pm 5\%$.
