DESCRIPTION

The P4C163 and P4C163L are 73,728-bit ultra high-speed static RAMs organized as 8K x 9. The CMOS memories require no clocks or refreshing and have equal access and cycle times. Inputs are fully TTL-compatible. The RAMs operate from a single 5V±10% tolerance power supply. With battery backup, data integrity is maintained for supply voltages down to 2.0V. Current drain is 10 μA from a 2.0V supply.

Access times as fast as 25 nanoseconds are available, permitting greatly enhanced system operating speeds. CMOS is used to reduce power consumption in both active and standby modes.

The P4C163 and P4C163L are available in 28-pin 300 mil DIP and SOJ and 28-pin 350 x 550 mil LCC packages providing excellent board level densities.

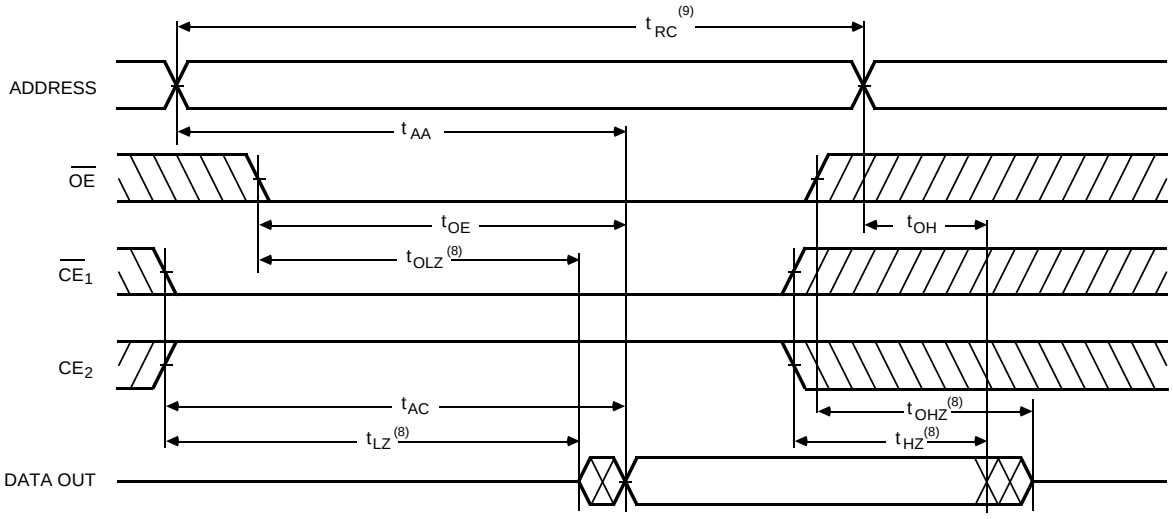
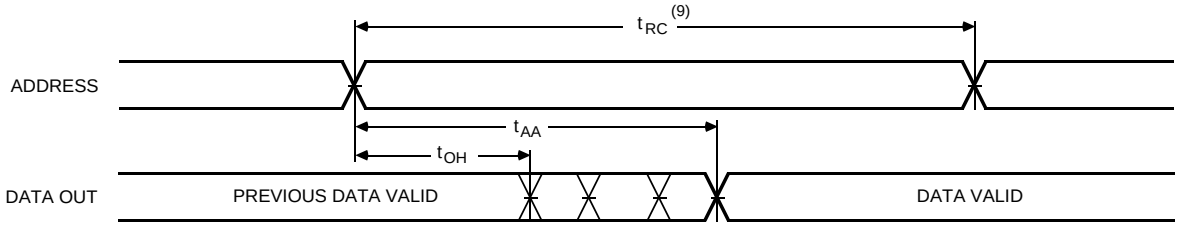
READ CYCLE NO. 1 ($\overline{OE}$ CONTROLLED)[5]



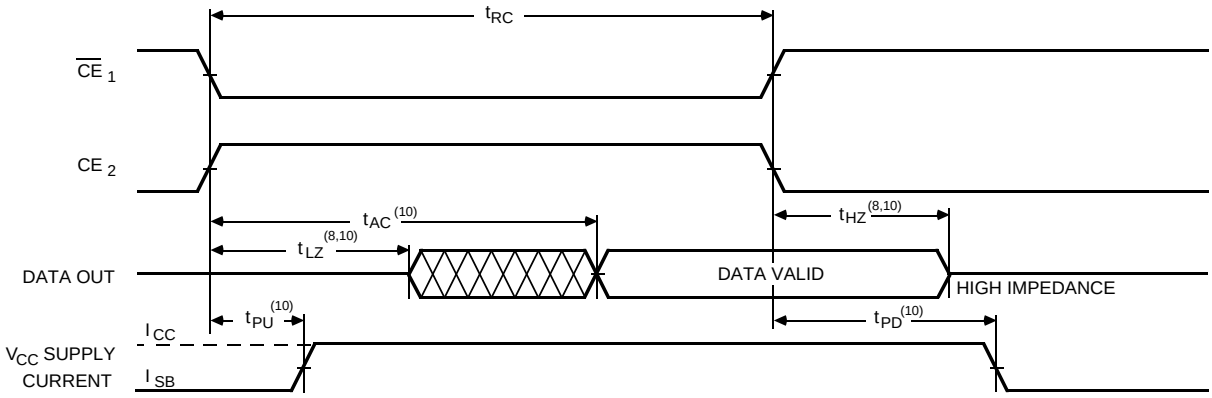
Notes:

5. $\overline{WE}$ is HIGH for READ cycle.
6. $\overline{CE_1}$ is LOW, CE_2 is HIGH and $\overline{OE}$ is LOW for READ cycle.
7. ADDRESS must be valid prior to, or coincident with $\overline{CE_1}$ transition LOW and CE_2 transition HIGH.
8. Transition is measured ± 200mV from steady state voltage prior to change, with loading as specified in Figure 1. This parameter is sampled and not 100% tested.

READ CYCLE NO. 2 (ADDRESS CONTROLLED)[5,6]



READ CYCLE NO. 3 ($\overline{CE}_1$, CE_2 CONTROLLED)[5,7,10]



Notes:

9. READ Cycle Time is measured from the last valid address to the first transitioning address.
10. Transitions caused by a chip enable control have similar delays irrespective of whether $\overline{CE}_1$ or CE_2 causes them.

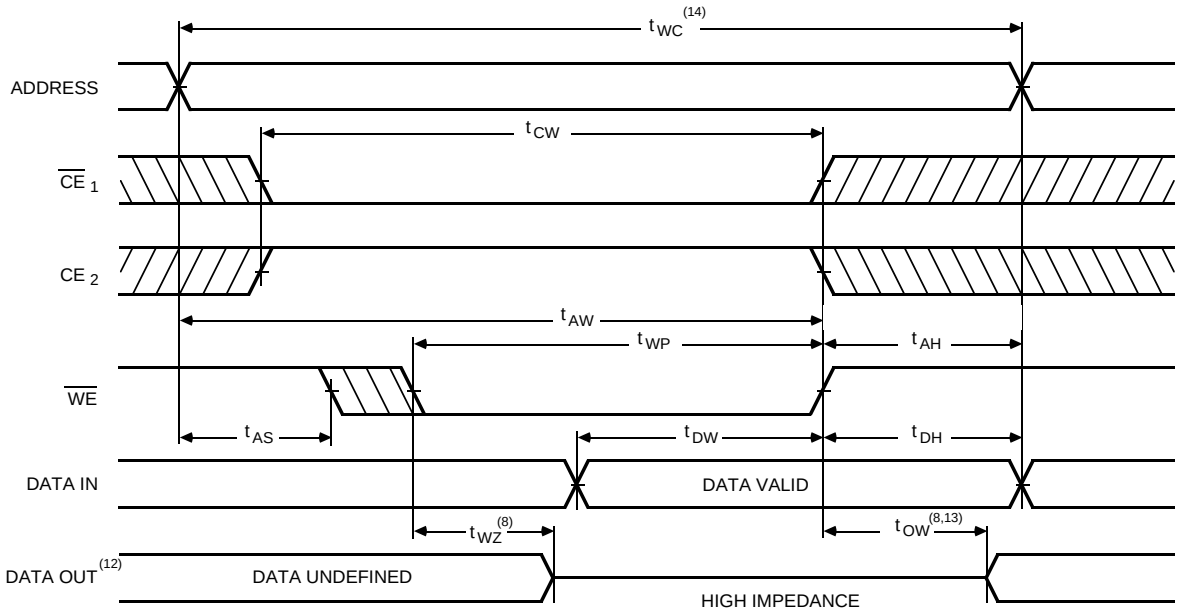
t_{OW}	Output Active from End of Write	3		5		5		ns

WRITE CYCLE NO. 1 ($\overline{WE}$ CONTROLLED)[11]



Notes:

11. $\overline{CE}_1$ and $\overline{WE}$ must be LOW, and CE_2 HIGH for WRITE cycle.
12. $\overline{OE}$ is LOW for this WRITE cycle to show t_{WZ} and t_{OW}.
13. If $\overline{CE}_1$ goes HIGH, or CE_2 goes LOW, simultaneously with $\overline{WE}$ HIGH, the output remains in a low impedance state.
14. Write Cycle Time is measured from the last valid address to the first transitioning address.

Note:
Because of the ultra-high speed of the P4C163/L, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the V_{CC} and ground planes directly up to the contactor fingers. A 0.01 µF high frequency capacitor is also required between V_{CC} and ground. To avoid signal reflections, proper termination must be used; for example, a 50Ω test environment should be terminated into a 50Ω load with 1.73V (Thevenin Voltage) at the comparator input, and a 116Ω resistor must be used in series with D_{OUT} to match 166Ω (Thevenin Resistance).
