

Features

- Low On-resistance: 60Ω typ, with $\pm 5V$ Supplies, Minimizes Distortion
- On-Resistance Matching between channels better than 6Ω
- Guaranteed Low Leakage Currents: $<0.1nA$ at $+25^\circ C$
- Rail-to-Rail Analog Signal Range
- Low Distortion: $<0.04\%$ (600Ω)
- Low Crosstalk: $-90dB$ @ $100kHz$
- TTL/CMOS Compatible (with $+5V$ or $\pm 5V$ Supplies)
- Low Power Consumption.
- 16-pin Narrow SOIC and QSOP Packages save board area
- Pin-compatible upgrades for 74HC4051/4052/4053

Applications

- Audio and Video Switching and Routing
- Lab and Medical Instrumentation
- Low-Voltage Data-Acquisition and Process Control Systems
- Battery-Powered Communication Systems

Description

The PS4051/PS4052/PS4053 are precision low-voltage CMOS analog multiplexers/switches.

The PS4051 is an eight-channel single-ended mux designed to select one of eight inputs to a common output. What input is selected depends on the status of three address bits (ADDA-ADDC). The PS4052 is a differential four-channel mux, controlled by two address bits: ADDA, and ADDB. The PS4053 is a triple 2-to-1 mux (or triple SPDT, single-pole double-throw, switch).

The INH (inhibit) pin can be driven high, to open all switches regardless of address bit status. All control inputs are TTL compatible when $V+ = +5V$.

These devices are designed to operate with power supplies from $\pm 2.7V$ to $\pm 8V$. Single-supply operation is possible from $+2.7V$ to $+16V$.

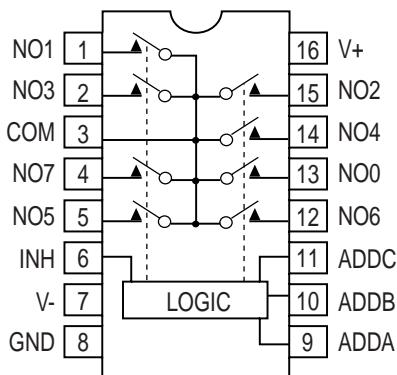

When on, each switch conducts current equally well in either direction and can handle rail-to-rail analog signals. In the off-state each switch blocks voltages up to the power-supply rails. Off-leakage current is guaranteed to be less than $0.1nA$ at $+25^\circ C$, and $< 2.5nA$ at $+85^\circ C$.

These devices are available in 16-pin DIP, Narrow SOIC, and QSOP packages for operation over the $-40^\circ C$ to $+85^\circ C$ temperature range.

Absolute Maximum Ratings

Voltages Referenced to V₋

V ₊	-0.3V to + 17V
GND	-0.3V to + 17V
GND	-0.3V to (V ₊) + 0.3V
V _{IN} , V _{COM} , V _{NO} ⁽¹⁾	(V ₋) -2V to (V ₊) + 2V or 30mA, whichever occurs first
Current (any terminal)	30mA
Peak Current, COM, NO, NC (pulsed at 1ms, 10% duty cycle)	100mA
ESD per method 3015.7	>2000V

Thermal Information

Continuous Power Dissipation

Plastic DIP (derate 10.5mW/°C above +70°C) 800mW
 Narrow SO and QSOP
 (derate 8.7mW/°C above +70°C) 650mW
 Storage Temperature -65°C to +150°C
 Lead Temperature (soldering, 10s) +300°C

Note 1:

Signals on NO, COM, or logic inputs exceeding V+ or V- are clamped by internal diodes. Limit forward diode current to 30mA.

Caution: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied.

Electrical Specifications - Dual Supplies

Notes:

- The algebraic convention, where most negative value is a minimum and most positive is a maximum, is used in this data sheet.
- Typical values are for DESIGN AID ONLY, not guaranteed or subject to production testing.
- Guaranteed by design
- $\Delta R_{ON} = R_{ON \text{ max}} - R_{ON \text{ min}}$
- Flatness is defined as the difference between the maximum and minimum values of on-resistance measured over the specific analog signal range, i.e., $V_{NO} = 3V$ to 0 and 0V to $-3V$.
- Leakage parameters are 100% tested at maximum rated hot temperature and guaranteed by correlation at $+25^\circ C$.
- Off Isolation = $20\log_{10} V_{COM} / V_{NO}$. See Figure 5.

Notes:

1. The algebraic convention, where the most negative value is a minimum and the most positive is a maximum, is used in this data sheet.
2. Typical values are for DESIGN AID ONLY, not guaranteed or subject to production testing.
3. Guaranteed by design
4. $\Delta R_{ON} = R_{ON} \text{ max} - R_{ON} \text{ min}$
5. Flatness is defined as the difference between the maximum and minimum value of on-resistance measured.
6. Leakage parameters are 100% tested at maximum rated hot temperature and guaranteed by correlation at +25°C.
7. Worst-case isolation is on channel 4 because of its proximity to the COM pin. Off isolation = $20\log V_{COM}/V_{NO}$,
V_{COM} = output, V_{NO} = input to off switch
8. Leakage testing at single supply is guaranteed by testing with dual supplies.
