Hex D flip-flop 74ALS174

FEATURES

- Four edge-triggered D flip-flops
- Buffered common clock
- Buffered asynchronous master reset

DESCRIPTION

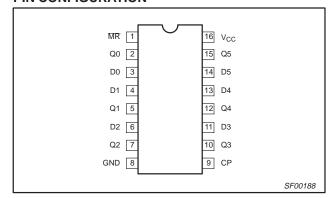

The 74ALS174 has six edge-triggered D-type flip-flops with individual D inputs and Q outputs. The common buffered clock (CP) and master reset ($\overline{\text{MR}}$) inputs load and reset (clear) all flip-flops simultaneously.

The register is fully edge-triggered. The state of each D input, one setup time before the Low-to-High clock transition is transferred to the corresponding flip-flop's Q output.

All Q outputs will be forced Low independent of clock or data inputs by a Low voltage level on the $\overline{\text{MR}}$ input. The device is useful for applications where true outputs only are required, and the clock and master reset are common to all storage elements.

I _{CC}	Supply current (total)	V _{CC} = MAX			7	14	mA

NOTES:

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
 All typical values are at V_{CC} = 5V, T_{amb} = 25°C.
 The output conditions have been chosen to produce a current that closely approximates one half of the true short-circuit output current, I_{OS}.
