74F552

Octal registered transceiver with parity
and flags (3-State)

Product specification

1991 Jan 02

IC15 Data Handbook

Octal registered transceiver with parity and flags (3-State)

74F552

FEATURES

- 8-bit bidirectional I/O port with handshake
- Register status flag flip-flops
- Separate clock enable and output enable
- Parity generation and parity check
- B outputs and parity output sink 64mA

DESCRIPTION

The 74F522 Octal Registered Transceiver contains two 8-bit registers for temporary storage of data flowing in either direction. Each register has its own Clock (CPR, CPS) and Clock Enable ($\overline{\text{CER}}$, $\overline{\text{CES}}$) inputs, as well as a flag flip-flop that is set automatically as the register is loaded. The flag output will be reset when the Output Enable returns to High after reading the output port. Each register has a separate Output Enable ($\overline{\text{OEAS}}$, $\overline{\text{OEBR}}$) for its 3-State buffer. The separate Clocks, Flags and Enables provide considerable flexibility as I/O ports for demand-response data transfer. When data is transferred from the A port to the B port, a parity bit is generated. On the other hand, when data is transferred from the B port to the A port, the parity of input data on B0–B7 is checked.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74F552	85MHz	120mA

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74F(U.L.) HIGH/LOW	LOAD VALUE HIGH/LOW
A0–A7	A Data inputs	3.5/1.0	70µA/0.6mA
B0–B7	B Data inputs	3.5/1.0	70µA/0.6mA
CPR	R registers clock input (active rising edge)	1.0/1.0	20µA/0.6mA
CPS	S registers clock input (active rising edge)	1.0/1.0	20µA/0.6mA
\overline{CER}	R registers clock Enable input (active Low)	1.0/1.0	20µA/0.6mA
\overline{CES}	S registers clock Enable input (active Low)	1.0/1.0	20µA/0.6mA
$\overline{OE\overline{B}R}$	A-to-B Output Enable input (active Low) and clear FS output (active Low)	1.0/2.0	20µA/1.2mA
\overline{OEAS}	B-to-A Output Enable input (active Low) and clear FR output (active Low)	1.0/2.0	20µA/1.2mA
PARITY	Parity bit transceiver input	3.5/1.0	70µA/0.6mA
	Parity bit transceiver output	750/106.7	15mA/64mA
\overline{ERROR}	Parity check output (active Low)	50/33.3	1.0mA/20mA
A0–A7	A Data outputs	150/40	3.0mA/24mA
B0–B7	B Data outputs	750/106.7	15mA/64mA
FR	A-to-B Status Flag output (active High)	50/33.3	1.0mA/20mA
FS	B-to-A Status Flag output (active High)	50/33.3	1.0mA/20mA

NOTE: One (1.0) FAST Unit Load is defined as: 20µA in the High state and 0.6mA in the Low state.

FUNCTIONAL DESCRIPTION

Data applied to the A inputs are entered and stored on the rising edge of the CPR clock pulse, provided that the \overline{CER} is Low; simultaneously, the status flip-flop is set and the A-to-B flag (FR) output goes High. As the \overline{CER} returns to High, the data will be held in R register. This data entered from the A inputs will appear at the B port I/O pins after the $\overline{OE\overline{B}R}$ has gone Low. When $\overline{OE\overline{B}R}$ is Low, a parity bit appears at the PARITY pin, which will be set High when there is an even number of 1s or all 0s at the Q outputs of the R register. After the data is assimilated, the receiving system clears the flag FR, by changing the signal at the $\overline{OE\overline{B}R}$ pin from Low to High. Data flow from B-to-A proceeds in the same manner described for A-to-B flow. A Low at the \overline{CES} pin and a Low-to-High transition at the CPS pin enters the B input data and the parity input data into the S register and the parity register respectively and set the flag output FS to High. A Low signal at the \overline{OEAS} pin enables the A port I/O pins and a Low-to-High transition of the \overline{OEAS} signal clears the FS flag. When \overline{OEAS} is Low, the parity check output \overline{ERROR} will be High if there is an odd number of 1s at the Q outputs of the S register and the parity register.

R or S REGISTER FUNCTION TABLE

INPUTS			OUTPUTS	OPERATING MODE
An or Bn	CPX	\overline{CEX}	INTERNAL Q	
X	X	H	NC	Hold data
L	↑	L	L	Load data
H	↑	L	H	
X	↑	L	NC	Keep old data

H = High voltage level
 L = Low voltage level
 NC= No change
 X = Don't care
X = R or S for CPX and CEX
 ↑ = Low-to-High transition
 † = Not Low-to-High transition

OUTPUT CONTROL TABLE

INPUT	OUTPUTS		OPERATING MODE
	$\overline{OE\overline{X}}$	INTERNAL Q	
H	X	Z	Disable outputs
L	L	L	Enable output
L	H	H	

H = High voltage level
 L = Low voltage level
 X = Don't care
XX= AS or BR
 Z = High impedance "off" state

		I _{ACL}				125	185	mA	
		I _{CCZ}				120	180	mA	

NOTES:

- For conditions shown as MIN or MAX, use the appropriate value under the recommended operating conditions for the applicable type.
- All typical values are at V_{CC} = 5V, T_{amb} = 25°C.
- Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} should be performed last.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
