

# Low voltage LNA and mixer - 1GHz

# SA601

## DESCRIPTION

The SA601 is a combined RF amplifier and mixer designed for high-performance low-power communication systems from 800-1200MHz. The low-noise preamplifier has a 1.6dB noise figure at 900MHz with 11.5dB gain and an IP3 intercept of -2dBm at the input. The gain is stabilized by on-chip compensation to vary less than ±0.2dB over -40 to +85°C temperature range. The wide-dynamic-range mixer has a 9.5dB noise figure and IP3 of -2dBm at the input at 900MHz. The nominal current drawn from a single 3V supply is 7.4mA. The Mixer can be powered down to further reduce the supply current to 4.4mA.

## FEATURES

- Low current consumption: 7.4mA nominal, 4.4mA with the mixer powered-down
- Outstanding LNA noise figure: 1.6dB at 900MHz
- High system power gain: 18dB (LNA + Mixer) at 900MHz
- Excellent gain stability versus temperature and supply voltage
- External >-7dBm LO can be used to drive the mixer

## PIN CONFIGURATION

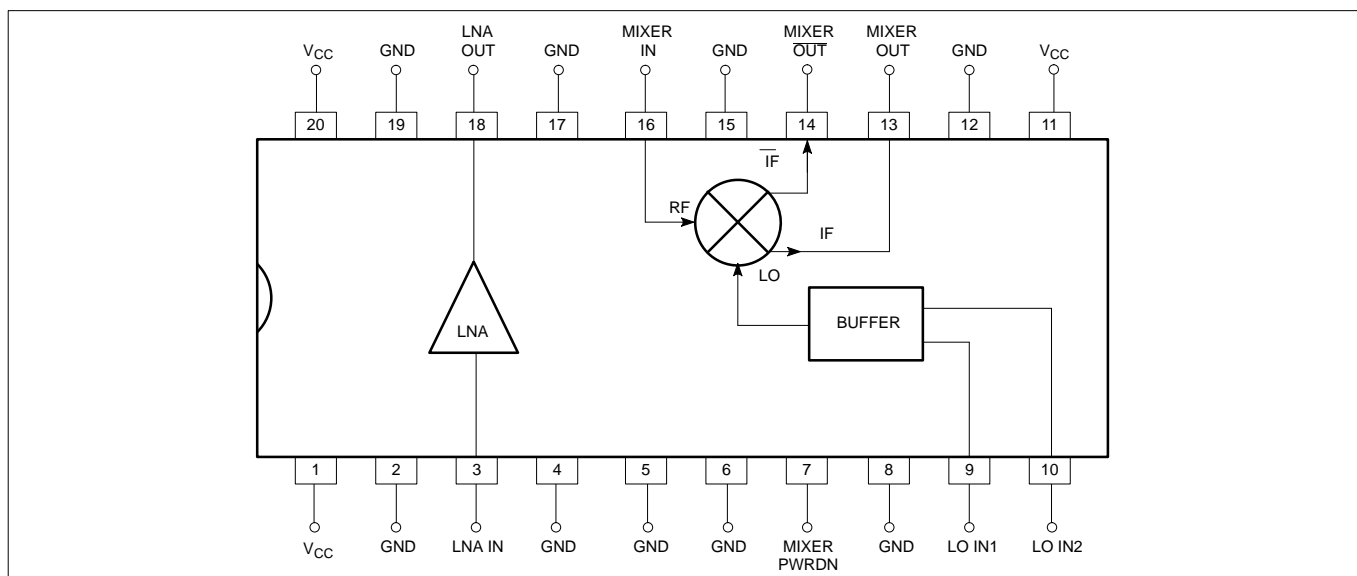

## APPLICATIONS

- 900MHz cellular front-end (NADC, GSM, AMPS, TACS)
- 900MHz cordless front-end (CT1, CT2)
- 900MHz receivers

**NOTE:**

1. Simple L/C elements are needed to achieve specified return loss.

## CIRCUIT TECHNOLOGY

### LNA

**Impedance Match:** Intrinsic return loss at the input and output ports is 7dB and 9dB, respectively. With no external matching, the associated LNA gain is ≈10dB and the noise figure is ≈1.4dB. However, the return loss can be improved at 881MHz using suggested L/C elements (Figure 1) as the LNA is unconditionally stable.

**Noise Match:** The LNA achieves 1.6dB noise figure at 881MHz when  $S_{11} = -10$ dB. Further improvements in  $S_{11}$  will slightly decrease the NF and increase  $S_{21}$ .

**Temperature Compensation:** The LNA has a built-in temperature compensation scheme to reduce the gain drift to 0.003dB/°C from -40°C to +85°C.

**Supply Voltage Compensation:** Unique circuitry provides gain stabilization over wide supply voltage range. The gain changes no more than 0.5dB when  $V_{CC}$  increases from 3V to 5V.

**LO Drive Level:** Resistor R1 can be replaced by an inductor of 4.7nH and C13 should be adjusted to achieve a good return loss at the LO port. Under this condition, the mixer will operate with less than -10dBm LO drive.

**IP3 Performance:** C9 between Pin 16 and ground can be removed to introduce 3dB mismatch loss, while improving the IP3 to +3dBm. The associated noise figure is 11dB.

### Mixer

**Input Match:** The mixer is configured for maximum gain and best noise figure. The user needs to supply L/C elements to achieve this performance.

**Power Gain:** The gain can be increased by approximately 1.5dB by placing R2 across C7, instead of C5.

**Power Down:** The mixer can be disabled by connecting Pin 7 to ground. When the mixer is disabled, 3mA is saved.

**Power Combining:** The mixer output circuit features passive power combining (patent pending) to optimize conversion gain and noise figure performance without using extra DC current or degrading the IP3. For IF frequencies significantly different than 83MHz, the component values must be altered accordingly.

**Filter Interface:** For system integration where a high impedance filter of 1kΩ is to be cascaded at the mixer IF output, capacitors C5 and C6 need to be changed to 27pF and 1000pF, respectively.
