FUNCTIONAL DESCRIPTION

The 74AC/ACT11543 Octal Latched Transceiver contains two sets of eight D-type latches, with separate input and controls for each set. For data flow from A to B, for example, the A-to-B

Enable (\overline{E}_{AB}) input must be Low in order to enter data from $A_0 - A_7$ or take data from $B_0 - B_7$ as indicated in the Function Table. With \overline{E}_{AB} Low, a Low signal on the A-to-B Latch Enable (\overline{LE}_{AB}) input makes the A-to-B latches transparent; a subsequent Low-to-High transition of the \overline{LE}_{AB} signal puts the A latches in the storage mode and their

outputs no longer change with the A inputs. With \overline{E}_{AB} and \overline{OE}_{AB} both Low, the 3-State B output buffers are active and display the data present at the outputs of the A latches. Control of data flow from B to A is similar, but using the \overline{E}_{BA} , \overline{LE}_{BA} , and \overline{OE}_{BA} inputs.

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
