

# Low saturation voltage type regulator with ON / OFF switch

## BA○○ST series

The BA○○ST series are variable, fixed output low drop-out type voltage regulators with an ON / OFF switch. These regulators are used to provide a stabilized output voltage from a fluctuating DC input voltage.

Fixed output voltages are 3V\*, 3.3V, 5V, 6V\* 7V, 8V, 9V, 10V, 12V, and 15V\*. The maximum current capacity is 1A for each of the above voltages. (Items marked with an asterisk are under development.)

### ●Applications

Constant voltage power supply

### ●Features

- 1) Built-in overvoltage protection circuit, overcurrent protection circuit and thermal shutdown circuit.
- 2) TO220FP-5 package can be used in wide range of applications.
- 3) 0 $\mu$ A (design value) circuit current when switch is off.
- 4) Richly diverse lineup.
- 5) Low minimum I / O voltage differential.

## ● Operation notes

## (1) Operating power supply voltage

When operating within the normal voltage range and within the ambient operating temperature range, most circuit functions are guaranteed. The rated values cannot be guaranteed for the electrical characteristics, but there are no sudden changes of the characteristics within these ranges.

## (2) Power dissipation

Heat attenuation characteristics are noted on a separate page and can be used as a guide in judging power dissipation.

If these ICs are used in such a way that the allowable power dissipation level is exceeded, an increase in the chip temperature could cause a reduction in the current capability or could otherwise adversely affect the performance of the IC. Make sure a sufficient margin is allowed so that the allowable power dissipation value is not exceeded.

(3) Output oscillation prevention and bypass capacitor  
Be sure to connect a capacitor between the output pin and GND to prevent oscillation. Since fluctuations in the value of the capacitor due to temperature changes may cause oscillations, a tantalum electrolytic capacitor with a small internal series resistance (ESR) is recommended.

A 22 $\mu$  F capacitor is recommended; however, be aware that if an extremely large capacitance is used (1000 $\mu$  F or greater), then oscillations may occur at low frequencies. Therefore, be sure to perform the appropriate verifications before selecting the capacitor.

Also, we recommend connecting a 0.33 $\mu$  F bypass capacitor as close as possible between the input pin and GND.

## (4) Current overload protection circuit

A current overload protection circuit is built into the out-

puts, to prevent IC destruction if the load is shorted.

This protection circuit limits the current in the shape of a '7'. It is designed with a high margin, so that even if a large current suddenly flows through the large capacitor in the IC, the current is restricted and latching is prevented. However, these protection circuits are only good for preventing damage from sudden accidents. The design should take this into consideration, so that the protection circuit is not made to operate continuously (for instance, clamping at an output of 1V<sub>F</sub> or greater; below 1V<sub>F</sub>, the short mode circuit operates). Note that the capacitor has negative temperature characteristics, and the design should take this into consideration.

## (5) Thermal overload circuit

A built-in thermal overload circuit prevents damage from overheating. When the thermal circuit is activated, the various outputs are in the OFF state. When the temperature drops back to a constant level, the circuit is restored.

(6) Internal circuits could be damaged if there are modes in which the electric potential of the application's input (V<sub>CC</sub>) and GND are the opposite of the electric potential of the various outputs. Use of a diode or other such bypass path is recommended.

(7) Although the manufacture of this product includes rigorous quality assurance procedures, the product may be damaged if absolute maximum ratings for voltage or operating temperature are exceeded. If damage has occurred, special modes (such as short circuit mode or open circuit mode) cannot be specified. If it is possible that such special modes may be needed, please consider using a fuse or some other mechanical safety measure.

(8) When used within a strong magnetic field, be aware that there is a slight possibility of malfunction.
