BS/CS Tuner Regulator with Reset, On/Off Function

Overview

The LA5607 is a low-dropout voltage regulator IC for BS/CS tuner applications, equipped with four regulators capable of ON/OFF control plus reset function.

Applications

- BS/CS tuner power supply system.
- Audio Video (AV) equipments with BS/CS recievers.
- Compact electronic equipment.

Functions

- Four low-dropout regulators (15.7 V/300 mA, 12 V/150 mA, 9 V/100 mA and 5 V/500 mA).
- Output on/off control ("L" active).
- On-chip protective circuitry (current limitter, thermal shut down).
- On-chip microcontroller reset signal generation circuit.

Features

- Supports compact set design while incorporating four regulators needed by BS/CS tuners.
- Flexible system design by independent on/off control of V_O1, V_O4, as well as V_O2 and V_O3 pair.
- Reduces internal loss by employment of low-dropout voltage regulators.
- Adapting three input pins contributes power dissipation reduction and heat sink design.
- On-chip reset signal generation circuit is most suitable for tuners using microcontrollers.

Function Table

The following table indicates conditions for operation with $V_{IN}1 \geq V_{IN}2 \geq V_{IN}3$ ($V_{IN}1 \geq 11$ V, $V_{IN}2 \geq 6$ V and $V_{IN}3 \geq 4$V).

EN1, EN2, EN3	V_O1, V_O2/V_O3, V_O4
H	L
L	H

① Within the table H of EN indicates an H level or open and L indicates an L level.

② H of V_O in the table indicates an output on voltage while L indicates an output off voltage.

③ All output voltages corresponding to all EN locations are controlled independently.
($EN1 \rightarrow V_O1$, $EN2 \rightarrow V_O2$ and V_O3, $EN3 \rightarrow V_O4$)

Notes for Above Applications

① GND1 and GND2 should be at same electric potential; since these are connected to the substrate of the LA5607, the lowest possible electric potential should be used. (If the electric potential of GND1 and GND2 differ, performance characteristics of the LA5607 can not be guaranteed.)

② Rise and fall times for $V_{IN}1$, $V_{IN}2$ and $V_{IN}3$ should be unified and concerning these pins operating in an open-circuit state or connected to the ground state is forbidden.

③ When $V_{IN}1$ and $V_{IN}2$ are open or lower than the required value, V_O1 to V_O4 are forced off for the IC's protection.

④ Use output capacitors $C_{OUT}1$ and $C_{OUT}4$ rated at 100 μF or more and $C_{OUT}2$ and $C_{OUT}3$ rated at 47 μF or more. To prevent oscillation at low temperature, be sure to use less temperature sensitive capacitors.

⑤ Use delay capacitor Cd which has little change in capacity caused by temperature, such as a tantalum capacitor.

⑥ In order to provide stable operation, $C_{IN}1$ to $C_{IN}3$ and $C_{OUT}1$ to $C_{OUT}4$ should be mounted as close to the LA5607 as possible.
