LR38269

DESCRIPTION

The LR38269 is a CMOS digital signal processor for color CCD camera system of 270 k/320 k-pixel CCD with complementary color filters. The camera system consists of CDS/AGC/ADC IC (IR3Y38M), DSP IC (LR38269), and V driver IC (LR36685) with CCD.

FEATURES

- Designed for 270 k/320 k color CCDs with Mg, G, Cy, and Ye complementary color filters
- Switchable between NTSC and PAL modes
- External control interface input/output
- Variable GAMMA and KNEE response (Select one out of 4 kinds of GAMMA & KNEE response)
- 10-bit digital input
- Analog NTSC/PAL composite output by built-in 9bit 1 ch DA converter
- Built-in mirror image function
- Built-in timing generator to drive CCD
- Built-in 2 k-bit EEPROM controller to set the camera adjustment data
- Built-in auto exposure control
- · Built-in auto white balance control
- Built-in auto carrier balance control
- Single + 3.3 V power supply
- Package :

80-pin LQFP (LQFP080-P-1212) 0.5 mm pin-pitch

In the absence of confirmation by device specification sheets, SHARP takes no responsibility for any defects that may occur in equipment using any SHARP devices shown in catalogs, data books, etc. Contact SHARP in order to obtain the latest device specification sheets before using any SHARP device.

Digital Signal Processor for Color CCD Cameras

PIN CONNECTIONS

PIN DESCRIPTION

PIN NO.	SYMBOL	I/O	POLARITY				DESCRIPTI	ION	
1	ACL	IC		Initializ	zing in	put.			
2	CKI	OSCI		Input	for refe	erence clo	ock oscillation. Connect	to CKO (pin 3) with R.	
3	СКО	OSCO		Outpu	utput for reference clock oscillation. The output is the inverse of CKI (pin 2).				
4	Vdd	-		Suppl	Supply of +3.3 V power.				
5	GND	-		A grou	unding	pin.			
6	ADCK	OBF6M		Clock	output	of AD co	onverter, connected to p	bin 13 of IR3Y38M.	
7	SCK	OBF4M		Clock	output	of serial	data, connected to pin	16 of IR3Y38M.	
8	SDATA	OBF4M		Serial	data c	output, co	nnected to pin 19 of IR	3Y38M.	
9	ADI9	IC		Digita	l signa	l input, fe	d from pin 12 of IR3Y3	8M (MSB).	
10	ADI8	IC		Digita	l signa	l input, fe	d from pin 11 of IR3Y3	8M.	
11	ADI7	IC		Digita	l signa	l input, fe	d from pin 10 of IR3Y3	8M.	
12	ADI6	IC		Digita	l signa	l input, fe	d from pin 9 of IR3Y38	М.	
13	ADI5	IC		Digita	l signa	l input, fe	d from pin 8 of IR3Y38	М.	
14	ADI4	IC	X	Digita	l signa	l input, fe	d from pin 5 of IR3Y38	М.	
15	Vdd	-		Suppl	y of +3	3.3 V pow	/er.		
16	GND	-		A grou	unding	pin.			
17	ADI3	IC		Digita	l signa	l input, fe	d from pin 4 of IR3Y38	М.	
18	ADI2	IC		Digita	Digital signal input, fed from pin 3 of IR3Y38M.				
19	ADI1	IC	\mathbf{X}	Digita	Digital signal input, fed from pin 2 of IR3Y38M.				
20	ADIo	IC	\mathbf{X}	Digita	Digital signal input, fed from pin 1 of IR3Y38M (LSB).				
21	OBCP	OBF4M	L L	Optica	Optical clamp pulse output, connected to pin 32 of IR3Y38M.				
22	ADCLP	OBF4M	L L	Clamp	o pulse	output, o	connected to pin 45 of I	R3Y38M.	
23	BLKX	OBF4M	U I	Blanki	ing pul	se output	, connected to pin 35 o	f IR3Y38M.	
24	EEPDA	IO4MU		Data i	input fr	om EEPF	ROM output pin.		
25	GND	-		Suppl	y of +3	3.3 V pow	/er.		
26	Vdd	-		A grou	unding	pin.			
07	FEDOK			Clock	output	to EEPF	OM clock input pin.		
21	EEFUR	1041010		This p	oin kee	ps high-ir	npedance under high le	evel of pin 29.	
28	EEPFL	IC		Contro	ol pin c	of EEPRC	M. Connect to the pull-	-up resistor.	
		10	~~~	Contro	ol pin d	of EEPRO	OM. A pull-down resiste	or should be connected between pin	
29	EEPSL			29 an	d GND	. High le	vel of pin 29 can make	data-setting from outside available.	
				White	baland	ce mode	setting by both WB1 an	nd WB2.	
		10414		P	in 30	Pin 31	White balance mode		
30	VVD1	104101			0	0	AUTO		
					0	1	PRESET WB1		
					1	0	PRESET WB2		
0.1					1	1	PRESET WB3		
31	VVD2	1041/1		In digi	ital out	put mode	e, pin 30 is assigned to	bit 0 (LSB) of U/V signal and pin 31	
				is ass	igned t	to bit 1.			

PIN NO.	SYMBOL	I/O	POLARITY	DESCRIPTION
				Video output mode setting.
32	MIR	IO4M		L : Normal H : Mirror
				In digital output mode, this pin is assigned to bit 2 of U/V signal.
				Backlight compensation selection.
33	BLC	IO4M		L:OFF H:ON
				In digital output mode, this pin is assigned to bit 3 of U/V signal.
34	GNDDA	-		A grounding pin of built-in DA converter.
35	Vddda	_		Supply of +3.3 V power of built-in DA converter.
36	Vв	DAO		Bias voltage output of built-in DA converter, connected to GND through a
		_		capacitor.
37	IREF	DAO		Bias current output of built-in DA converter, connected to GND through a resistor.
38	VREF	DAI		Bias voltage input of built-in DA converter, connected to +1.0 V power supply.
39	GNDDA	-		A grounding pin of built-in DA converter.
40	VIDEO	DAO		Analog video signal output.
41	EEMDS	IO4MU		Electronic exposure mode setting by EEMDS, EEMD1, EEMD2 and EEMD3.
42	EEMD1	IO4MU		See "Electronic Shutter Speed Setting" in AUTOMATIC CAMERA FUNCTION
43	EEMD2	IO4MU		CONTROL.
44	EEMD3	IO4MU		In digital output mode, 41 to 44 pins are assigned to bits 7 to 4 of U/V signals.
45	GND	-		A grounding pin
46	Vdd	-		Supply of +3.3 V power.
47				Clock output for digital signal output.
41	DOKI			Output mode setting switches to CSYNC output.
				ID pulse output for U/V output signal. In digital output, this pin outputs KEI-
				PULSE.
10	DOK			
48	DCK2			NOTE · KEI-PUILSE
				At power-on, it keeps low. Both 1/60 s (PAL 1/50 s) as shutter speed and AGC gain
				more than data of address 78h sets it high.
				Bit 3 of address 03h sets the function of this pin.
49	EXCKI	IC		1 : Clock input of 13.5 MHz for digital output
				0 : VRI input for analog output
50	Yo	OBF4M	$\overline{\mathbf{X}}$	Bit 0 (LSB) of digital luminance signal output.
51	Y1	OBF4M	X	Bit 1 of digital luminance signal output.
52	Y2	OBF4M	X	Bit 2 of digital luminance signal output.
53	Y3	OBF4M	X	Bit 3 of digital luminance signal output.
54	GND	_		A grounding pin.
55	Vdd	_		Supply of +3.3 V power.
56	Y4	OBF4M	$\overline{\mathbf{X}}$	Bit 4 of digital luminance signal output.
57	Y5	OBF4M	TX I	Bit 5 of digital luminance signal output.
58	Y6	OBF4M		Bit 6 of digital luminance signal output.

PIN NO.	SYMBOL	I/O	POLARITY	DESCRIPTION				
59	Y7	OBF4M	X	Bit 7 (MSB) of digital luminance signal output				
				Horizontal driving pulse output. Either CCD driving timing or BELL-PULSE is				
				selected by output mode setting.				
60	HD	OBF4M	Л					
				NOTE : BELL-PULSE				
				Some period with high level every field.				
				Vertical driving pulse output.				
61	VD	OBF4M	Л	Either VD or CSYNC with either driving timing or video output timing is selected				
				by output mode setting.				
62	V1X	OBF4M	Л	Vertical driving pulse output, connected to pin 20 of LR36685.				
63	V2X	OBF4M	Л	Vertical driving pulse output, connected to pin 21 of LR36685.				
64	Vзх	OBF4M		Vertical driving pulse output, connected to pin 18 of LR36685.				
65	V4X	OBF4M		Vertical driving pulse output, connected to pin 14 of LR36685.				
66	Vdd	-		Supply of +3.3 V power.				
67	GND	-		A grounding pin.				
68	VH1X	OBF4M		/ertical driving pulse output, connected to pin 19 of LR36685.				
69	VНзх	OBF4M		Vertical driving pulse output, connected to pin 15 of LR36685.				
70	OFDX	OBF6M		OFD driving pulse output, connected to pin 22 of LR36685.				
71	Vdd	-		Supply of +3.3 V power.				
72	GND	-		A grounding pin.				
73	FR	OBF12M		Reset pulse output, connected to CCD through a capacitor.				
74	FH1	OBF12M		Horizontal driving pulse output, connected to CCD.				
75	FH ₂	OBF12M		Horizontal driving pulse output, connected to CCD.				
76	Vdd	-		Supply of +3.3 V power.				
77	GND	-		A grounding pin.				
78	RS	OBF6M		Sample-hold pulse output, connected to pin 31 of IR3Y38M.				
79	FS	OBF6M		Sample-hold pulse output, connected to pin 30 of IR3Y38M.				
80	FCDS	OBF6M		Sample-hold pulse output, connected to both pin 28 and pin 29 of IR3Y38M.				
IC	: Input pi	n		IO4MU : Input/output pin with pull-up resistor				
OBF4N	/ : Output	pin		OSCI : Input pin for oscillation

NOTES :

- 1. Applied to inputs (IC, IO4M, IO4MU).
- 2. Applied to input (IO4MU).
- 3. Applied to outputs (OBF4M, IO4M, IO4MU).
- 4. Applied to output (OBF6M).
- 5. Applied to output (OBF12M).

- 6. Applied to output (OSCO).
- 7. Applied to output (VIDEO).
- 8. Applied to input (VREF).
- 9. Applied to output (IREF).

Data Interface

- (1) Format of data transfers
- Format of transfers : Asynchronous (Based on RS-232C standard)
- Bit rate : 9 600 bps
- Data length : 8 bits
- Parity check : 1 even parity bit
- Start bit : 1 bit
- Stop bit : 1 bit
- Signal voltage level (CMOS)

System configuration

AUTOMATIC CAMERA FUNCTION CONTROL

Automatic Electronic Exposure Control

Electronic shutter speed is controlled so that the exposure control data approach to the data of address 04h.

Under BLC mode, the data of address 07h is available instead of address 04h.

After the exposure control data is less than the data of address 05h, an electronic shutter speed is hold. And then AGC gain is controlled so that the exposure control data will be less than the data of address 06h.

In the case of coming more than the data of address 07h, exposure control starts again.

Electronic Shutter Speed Setting

By either hardware or coefficient data, electronic shutter speed below is selectable.

FEMDO	EEMD.	FEMDa		ELECTRONIC SHUTTER SPEED		
				NTSC	PAL	
0	0	0	0	1/60 s	1/50 s	
0	0	0	1	1/100 s	1/120 s	
0	0	1	0	1/250 s	1/250 s	
0	0	1	1	1/500 s	1/500 s	
0	1	0	0	1/1 000 s	1/1 000 s	
0	1	0	1	1/2 000 s	1/2 000 s	
0	1	1	0	1/5 000 s	1/5 000 s	
0	1	1	1	1/10 000 s	1/10 000 s	
1	0	0	0	1/20 000 s	1/20 000 s	
1	0	0	1	1/50 000 s	1/50 000 s	
1	0	1	0	1/100 000 s	1/100 000 s	
1	0	1	1	1/30 s	1/25 s	
1	1	0	0	1/15 s	1/12.5 s	
1	1	0	1	1/7.5 s	1/6.25 s	
	4	_	0	AUTO	AUTO	
	I	I	0	1/60 to 1/100 000 s	1/50 to 1/100 000 s	
1	_	_		AUTO	AUTO	
1				1/60 to 1/100 000 s	1/50 to 1/100 000 s	

Slower shutter speed less than 1/60 s (1/50 s of PAL) can make images whose interval is every two fields, every four fields, etc..

VD pulse is also converted to the same frequency as the output image rate.

Electronic exposure control data comes from below equation using averaged luminance levels of 64 areas in one image, made by DSP.

Electronic exposure control data =

- [{Weighted data 1 \bigcirc x (64 address 10h)
- + weighted data 2 ② x address 10h} ÷ 64
- x (256 address 14h address 15h)
- + top level ③ x address 14h
- + bottom level ④ x address 15h] ÷ 256

Y11	Y12	Y13	Y14	Y15	Y16	Y17	Y18
Y21	Y22	Y23	Y24	Y25	Y26	Y27	Y28
Y31	Y32	Y33	Y34	Y35	Y36	Y37	Y38
Y41	Y42	Y43	Y44	Y45	Y46	Y47	Y48
Y51	Y52	Y53	Y54	Y55	Y56	Y57	Y58
Y61	Y62	Y63	Y64	Y65	Y66	Y67	Y68
Y71	Y72	Y73	Y74	Y75	Y76	Y77	Y78
Y81	Y82	Y83	Y84	Y85	Y86	Y87	Y88

1 Weighted data 1

This comes from the following equation weighting in horizontal.

Weighting factors are the data from address 08h to address 0Fh.

{(Y11 + Y12 ··· + Y18) ÷ 8 x address 08h + (Y21 + Y22 ··· + Y28) ÷ 8 x address 09h

+ (Y₈₁ + Y₈₂ ··· + Y₈₈) ÷ 8 x address 0Fh} ÷ 256 = Weighted data 1

The sum from address 08h to address 0Fh shall be 256.

2 Weighted data 2

Weighting area can be set by the data of address 11h and address 12h. (see "NOTES" in Gamma Characteristic Option)

This comes from the following equation weighting in selected areas.

(Y₃₃ + Y₃₄ ··· + Y₆₆)/number of areas to be selected = Weighted data 2

- ③ Top level : The highest luminance data in one image by averaging either 4 pixels or 8 pixels in horizontal.
- ④ Bottom level : The lowest luminance data in one image by averaging either 4 pixels or 8 pixels in horizontal.

Auto White Balance Control

White balance control data less than the data of address 51h and address 52h stops AWB.

White balance control data less than the data of address 4Fh and address 50h makes AWB active so that white balance control data is less than the data of address 51h and address 52h.

In the case of larger than the data of address 4Fh and address 50h, AWB will be active again.

White balance data comes from the following equation using averaged I and Q data of 16 areas in one image.

l11	112	l13	I 14
l 21	122	I 23	I 24
I 31	I 32	133	I 34
l 41	l 42	l 43	44

Q11	Q12	Q13	Q14
Q21	Q 22	Q23	Q24
Q31	Q32	Q33	Q 34
Q41	Q42	Q43	Q44

White balance data =

{Weighted data 3 (1) x (64 – address 44h)

+ weighted data 4 ② x address 44h} ÷ 64

SHARP

① Weighted data 3

I (or Q) data comes from the following equation using the weighting data from address 40h to address 43h.

{(I11 + I12 ··· + I14) ÷ 4 x address 40h + (I21 + I22 ··· + I24) ÷ 4 x address 41h : + (I41 + I42 ··· + I44) ÷ 4 x address 43h} ÷ 256 = Weighted data 3

The sum from the data of address 40h to the data of address 43h shall be 256.

2 Weighted data 4

Weighting area can be selected by address 45h. (see "NOTES" in Gamma Characteristic Option.) Weighted data comes from averaged data in selected area.

③ White balance area setting

The sum of I and Q can be regulated by the luminance level and the color level.

Setting target zone : address 47h to address 4Ah White balance data less than the data of address 51h and address 52h changes the target zone of auto white balance to the zone by the data from address 4Bh to 4Eh.

Above regulation comes from the following equation along the luminance level.

Setting available luminance level range : Highest luminance level limiter = address 3Bh + [{address 3Eh x H peak level + (256 - address 3Eh) x exposure control data} ÷ 256 - address 3Dh] x address 3Fh

Lowest luminance level limiter = address 3Ch + [{address 3Eh x H peak level +

(256 - address 3Eh) x exposure control data} \div

256 - address 3Dh] x address 3Fh

Auto Color Matrix Compensation

Color matrix compensation can be done by $R - Y = R - Y \pm (Data \ 1 \times B - Y)$ $B - Y = B - Y \pm (Data \ 2 \times R - Y)$

Above data comes from below equation along the variation of color temperature.

Data 2 = address 55h + {(working R white balance data – address 25h + (address 26h – working B white balance data)} \div 32 x address 53h \div 8

Data 2 =

address 56h + {(working R white balance data – address 25h) + (address 26h – working B white balance data)} \div 32 x address 54h \div 8

Auto Color Level Compensation

Color level can be auto-controlled by the following equation along the variation of color temperature.

B - Y level =

address 30h + {(working R white balance data – address 25h) x address 22h + (address 26h – working B white balance data) x address 23h} \div 32 x address 2Eh \div 8

R - Y level =

address 31h + {(working R white balance data – address 25h) x address 22h + (address 26h – working B white balance data) x address 23h} \div 32 x address 2Fh \div 8

Color Level Suppression Under Lower Illuminance

Working AGC gain can control both R - Y level and B - Y level by the following equation.

```
R - Y level =
```

```
address 31h x {16 - (working AGC gain - address
5Ah) x address 5Bh ÷ 16} ÷ 16
B - Y level =
```

address 30h x {16 - (working AGC gain - address 5Ah) x address 5Bh \div 16} \div 16

 $\{16 - (working AGC gain - address 5Ah) x address 5Bh ÷ 16\} \le 16$

When (working AGC gain – address 5Ah) \leq 0, () = 0.

Aperture Level Suppression Under Illuminance

Working AGC gain can control both the horizontal aperture level and the vertical aperture level by the following equation.

Horizontal aperture level = address 68h x {16 - (working AGC gain - address 63h) x address 64h \div 16} \div 16

Vertical aperture level = address 6Ah x {16 - (working AGC gain - address 63h) x address 64h \div 16} \div 16

 $\{16 - (working AGC gain - address 63h) x address 64h ÷ 16\} \le 16$

When (working AGC gain – address 63h) \leq 0, () = 0.

Gamma Characteristic Option

- (1) Luminance Signal Gamma Option
- Bit 7 and bit 6 of address 02h can select one out of

4 responses below.

(2) Color Signal Gamma OptionBit 5 and bit 4 of address 02h can select one out of 4 responses below.
