The S-29XX0A Series is high speed, low power 1K/2K/4K-bit E²PROM with a wide operating voltage range. They are organized as 64-word×16-bit, 128-word×16-bit and 256-word×16-bit, respectively. Each is capable of sequential read, at which time addresses are automatically incremented in 16-bit blocks. The instruction code is compatible with the NM93CSXX Series.

■ Features

- Low power consumption
 - Standby : 1.0 μA Max. (VCC = 6.5 V)
 - Operating : 0.8 mA Max. (VCC = 5.5 V)
 - : 0.4 mA Max. (VCC = 2.5 V)
- Wide operating voltage range
 - Write : 2.5 to 6.5 V
 - Read : 1.8 to 6.5 V
- Sequential read capable
- Endurance : 10⁵ cycles/word
- Data retention : 10 years
- S-29130A : 1K bits NM93CS46 instruction code compatible
- S-29220A : 2K bits NM93CS56 instruction code compatible
- S-29230A : 2K bits CAT35C102 instruction code compatible
- S-29330A : 4K bits NM93CS66 instruction code compatible

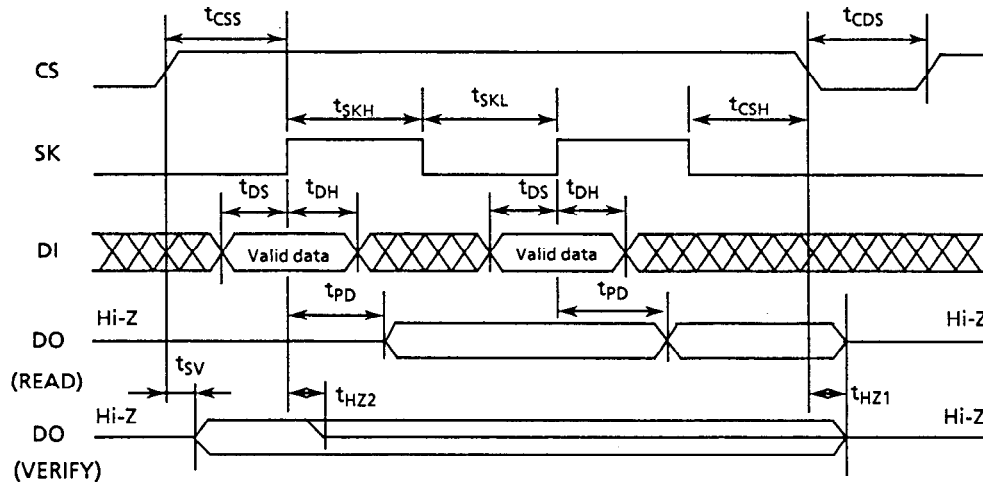

Figure 3 Timing Chart

■ Operation

Instructions (in the order of start-bit, instruction, address, and data) are latched to DI in synchronization with the rising edge of SK after CS goes high. A start-bit can only be recognized when the high of DI is latched to the rising edge of SK when CS goes from low to high, it is impossible for it to be recognized as long as DI is low, even if there are SK pulses after CS goes high. Any SK pulses input while DI is low are called "dummy clocks." Dummy clocks can be used to adjust the number of clock cycles needed by the serial IC to match those sent out by the CPU. Instruction input finishes when CS goes low, where it must be between commands during t_{CDS} .

All input, including DI and SK signals, is ignored while CS is low, which is stand-by mode.

1. Read

The READ instruction reads data from a specified address. After A0 is latched at the rising edge of SK, DO output changes from a high-impedance state (Hi-Z) to low level output. Data is continuously output in synchronization with the rise of SK.

When all of the data (D0) in the specified address has been read, the data in the next address can be read with the input of another SK clock. Thus, it is possible for all of the data addresses to be read through the continuous input of SK clocks as long as CS is high.

The last address ($A_n \dots A_1 A_0 = 1 \dots 11$) rolls over to the top address ($A_n \dots A_0 = 0 \dots 00$).

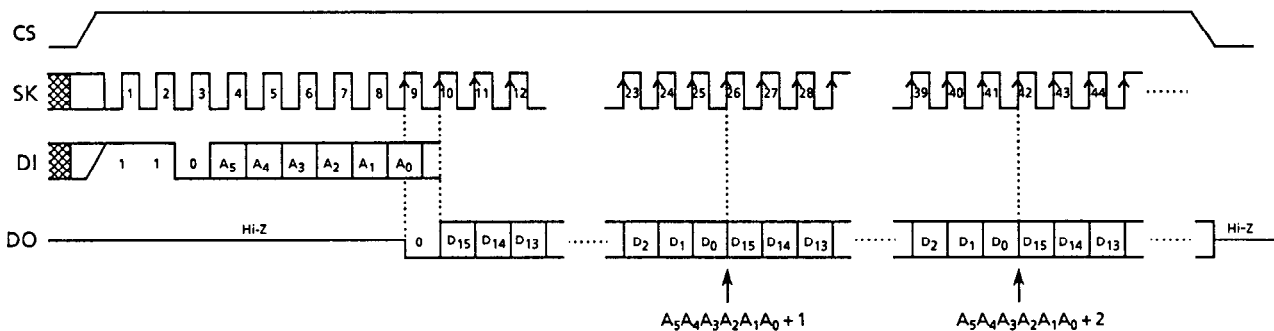

Figure 4 Read Timing (S-29130A)

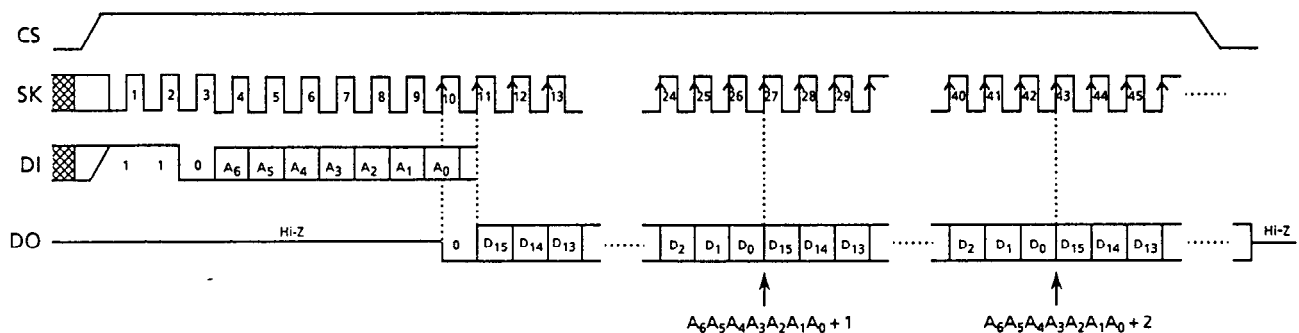

Figure 5 Read Timing (S-29230A)

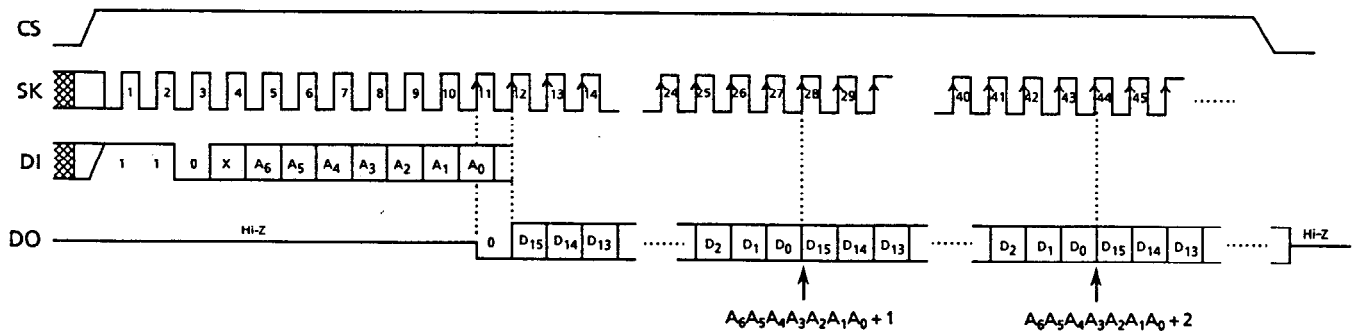

Figure 6 Read Timing (S-29220A)

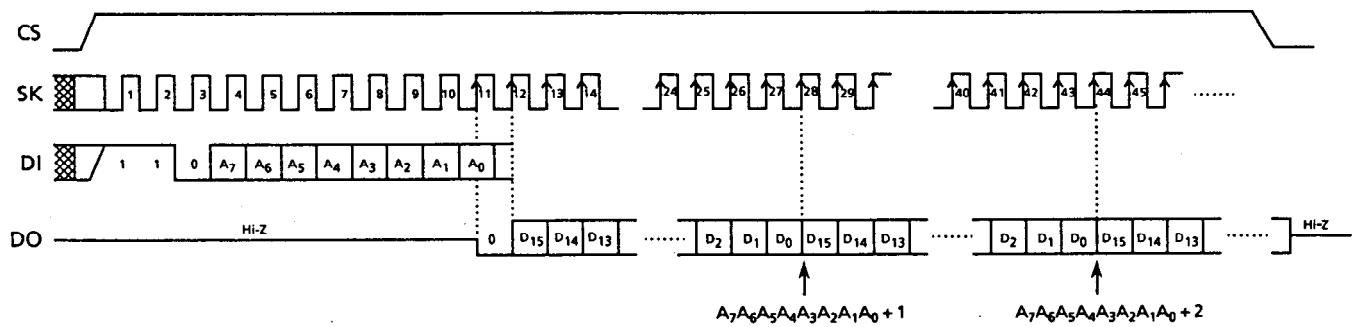

Figure 7 Read Timing (S-29330A)

2. WRITE (WRITE, ERASE, WRAL, ERAL)

There are four write instructions, WRITE, ERASE, WRAL, and ERAL. Each automatically begins writing to the non-volatile memory when CS goes low at the completion of the specified clock input.

The write operation is completed in 10 ms (t_{PR} Max.), and the typical write period is less than 5 ms. In the S-29XX0A Series, it is easy to VERIFY the completion of the write operation in order to minimize the write cycle by setting CS to high and checking the DO pin, which is low during the write operation and high after its completion. This VERIFY procedure can be executed over and over again.

Because all SK and DI inputs are ignored during the write operation, any input of instruction will also be disregarded. When DO outputs high after completion of the write operation or if it is in the high-impedance state (Hi-Z), the input of instructions is available. Even if the DO pin remains high, it will enter the high-impedance state upon the recognition of a high of DI (start-bit) attached to the rising edge of an SK pulse. (see Figure 3).

DI input should be low during the VERIFY procedure.

2.1 WRITE

This instruction writes 16-bit data to a specified address.

After changing CS to high, input a start-bit, op-code (WRITE), address, and 16-bit data. If there is a data overflow of more than 16 bits, only the last 16-bits of the data is considered valid. Changing CS to low will start the WRITE operation. It is not necessary to make the data "1" before initiating the WRITE operation.

Figure 8 WRITE Timing (S-29130A)

Figure 9 WRITE Timing (S-29230A)

Figure 10 WRITE Timing (S-29220A)

Figure 11 WRITE Timing (S-29330A)

2.2 ERASE

This command erases 16-bit data in a specified address.

After changing CS to high, input a start-bit, op-code (ERASE), and address. It is not necessary to input data. Changing CS to low will start the ERASE operation, which changes every bit of the 16 bit data to "1."

Figure 12 ERASE Timing (S-29130A)

Figure 13 ERASE Timing (S-29230A)

Figure 14 ERASE Timing (S-29220A)

Figure 15 ERASE Timing (S-29330A)

2.3 WRAL

This instruction writes the same 16-bit data into every address.

After changing CS to high, input a start-bit, op-code (WRAL), address (optional), and 16-bit data. If there is a data overflow of more than 16 bits, only the last 16-bits of the data is considered valid. Changing CS to low will start the WRAL operation. It is not necessary to make the data "1" before initiating the WRAL operation.

Figure 16 WRAL Timing (S-29130A)

Figure 17 WRAL Timing (S-29230A)

Figure 18 WRAL Timing (S-29220A)

Figure 19 WRAL Timing (S-29330A)

2.4 ERAL

This instruction erases the data in every address.

After changing CS to high, input a start-bit, op-code (ERAL), and address (optional). It is not necessary to input data. Changing CS to low will start the ERAL operation, which changes every bit of data to "1."

Figure 22 ERAL Timing (S-29220A)

Figure 23 ERAL Timing (S-29330A)

CMOS SERIAL E²PROM
S-29XX0A Series

3. Write enable (EWEN) and Write disable (EWDS)

The EWEN instruction puts the S-29XX0A Series into write enable mode, which accepts WRITE, ERASE, WRAL, and ERAL instructions. The EWDS instruction puts the S-29XX0A Series into write disable mode, which refuses WRITE, ERASE, WRAL, and ERAL instructions.

The S-29XX0A Series powers on in write disable mode, which protects data against unexpected, erroneous write operations caused by noise and/or CPU malfunctions. It should be kept in write disable mode except when performing write operations.

Figure 24 EWEN/EWDS Timing (S-29130A)

Figure 25 EWEN/EWDS Timing (S-29230A)

Figure 26 EWEN/EWDS Timing (S-29220A)

Figure 27 EWEN/EWDS Timing (S-29330A)

■ Receiving a Start-Bit

Both the recognition of a start-bit and the VERIFY procedure occur when CS is "high". Therefore, only after a write operation, in order to accept the next command by having CS go high, will the DO pin switch from a state of high-impedence to a state of data output; but if it recognizes a start-bit, the DO pin returns to a state of high-impedence.

■ Three-wire Interface (DI-DO direct connection)

Although the normal configuration of a serial interface is a 4-wire interface to CS, SK, DI, and DO, a 3-wire interface is also a possibility by connecting DI and DO. However, since there is a possibility that the DO output from the serial memory IC will interfere with the data output from the CPU with a 3-wire interface, install a resistor between DI and DO in order to give preference to data output from the CPU to DI (See Figure 28).
