**PWM STEP-UP SWITCHING REGULATOR  
WITH VOLTAGE DETECTORS**

**S-8310/8311 Series**

The 8310/8311 Series includes a CMOS PWM step-up switching regulator that consists of a reference voltage source, a CR oscillation circuit, a power MOS FET and two voltage detectors. Output voltage is fixed internally and a shutdown function is available. Current consumption is drastically reduced because of the CMOS configuration. The 8310/8311 Series offers low voltage operation. The S-8310 Series easily forms a step-up switching regulator by attaching only a coil, a diode and capacitors externally. The S-8311 Series has a function of input voltage clamp. Both series are suitable for use as power sources for portable devices.

■ **Features**

- Low voltage operation: 0.9 V min.
- Low current consumption: 23  $\mu$ A typ. (S-8310AFE, ISS)
- High-precision output voltage:  $\pm 2.4\%$
- Shutdown function
- Two voltage detectors
- Internal switching current limit circuit
- Adjustable voltage clamp circuit (S-8311)
- SOP-8, SSOP-16 package

■ **Applications**

- Power supplies for portable equipment such as pagers, handy calculators, and remote controllers
- Constant voltage power supplies for cameras, video equipment, and communications equipment
- Power supply for microcomputers

■ **Block Diagram**

(1) S-8310 Series

(2) S-8311 Series

- \* The two voltage detectors have Nch open-drain.
- \* P means a power line.

## S-8310/8311 Series

### ■ Selection Guide

#### 1. Name of the Product

#### 2. List of the Product

Name	Item	Output Voltage (V)	Detection Voltage VD1 (V)	Detection Voltage VD2 (V)
S-8310AFE		3.00	2.20	0.90
S-8310BFE		2.50	2.20	0.80
S-8310CFE		3.00	2.20	1.10
S-8310DFE		2.70	2.20	1.00
S-8311AF5		2.00	1.90	0.95

Note 1: Voltage values shown above are typical.

Note 2: For other values, contact SII's or SIU's IC Sales Dept.

### ■ Pin Assignment

Figure 2

Pin name	S-8310	S-8311	Functions
CONT	8	16	External inductor connection terminal
V <sub>SS</sub>	1	1	GND terminal
$\overline{SD1}$	2	3	Shutdown terminal for Step-up "H": Operation "L": Step-up stop
V <sub>FB</sub>	6	13	Feedback voltage terminal for step-up
V <sub>OUT</sub>	7	14	Positive power terminal for voltage detectors, step-up and clamp circuit
VD1 <sub>OUT</sub>	5	9	Output terminal for VD1
SENSE	3	6	Sensing terminal for Voltage Detector 2 (VD2)
VD2 <sub>OUT</sub>	4	7	Output terminal for VD2
V <sub>IN</sub>	—	12	Sensing terminal for clamp circuit
V <sub>BASE</sub>	—	10	External transistor connection terminal
SENV <sub>IN</sub>	—	11	Sensing terminal for primary battery
$\overline{SD2}$	—	4	Shutdown terminal for voltage clamp "H": Clamp operation "L": Stop
SENGND	—	5	External resistors connection terminal

Note: In the S-8311 Series, pin Nos. 2, 8, and 15 are NC.

■ **Operation**

1. Step-Up Regulator

The step-up regulator consists of a power MOS EFT, a CR oscillation circuit and an error amplifier.

M1 is turned ON or OFF by the CR oscillation circuit. When M1 is turned ON ( $t_{ON}$ ), the energy is stored in the inductor (L); when M1 is turned OFF ( $t_{OFF}$ ), the stored energy is supplied via the diode to the capacitor ( $C_{OUT}$ ) of  $V_{OUT}$  (see Figure 4).

The  $V_{OUT}$  output voltage can be selected between 1.8V and 3.6V by 0.1V step.

$\overline{SD1}$  pin: Stops or starts step-up operation. M1 is turned OFF.

When turning  $\overline{SD1}$  pin low, all of internal circuits stop their operation. This allows the current consumption to be reduced drastically. DO NOT use the  $\overline{SD1}$  terminal in floating state because of no internal pulling-up and -down.

Shut-down pin	CR oscillation circuit	Output voltage
"H"	Operation	Fixed
"L"	Stop	$\approx V_{IN}^*$

\* Voltage obtained by extracting the voltage drop due to DC resistance of the inductor, and the diode forward voltage from  $V_{IN}$

The following are basic equations [(1) through (7)] of the step-up switching regulator (see Figure 4).

Current  $I_L$  flowing into L is zero the moment M1 is turned ON:

$$V_A = V_S \dots\dots\dots (1)$$

( $V_S$ : Non-saturated voltage of M1)

The change in  $I_L$  over time:

$$\frac{dI_L}{dt} = \frac{V_L}{L} = \frac{V_{IN} - V_S}{L} \dots\dots\dots (2)$$

Integration of the above equation ( $I_L$ ):

$$I_L = \left( \frac{V_{IN} - V_S}{L} \right) \cdot t \dots\dots\dots (3)$$

$I_L$  flows when M1 is turned ON ( $t_{ON}$ ). The time is determined by the oscillation frequency of the OSC.

The peak current ( $I_{PK}$ ) after M1 is turned ON ( $t_{ON}$ ):

$$I_{PK} = \left( \frac{V_{IN} - V_S}{L} \right) \cdot t_{ON} \dots\dots\dots (4)$$

The energy stored in L is represented with  $\frac{1}{2}L(I_{PK})^2$ .

When M1 is turned OFF ( $t_{OFF}$ ), the energy stored in L is transmitted through a diode to the output capacitor. Then reverse voltage ( $V_L$ ) is output.

$$V_L = (V_{OUT} + V_D) - V_{IN} \dots\dots\dots (5)$$

( $V_D$ : Diode forward voltage)

The voltage at CONT pin rises only by the voltage corresponding to  $V_{OUT} + V_D$ .

When M1 is turned OFF ( $t_{OFF}$ ), the current flowing through the diode into  $V_{OUT}$  changes as follows:

$$\frac{dI_L}{dt} = \frac{V_L}{L} = \frac{V_{OUT} + V_D - V_{IN}}{L} \dots\dots\dots (6)$$

# PWM STEP-UP SWITCHING REGULATOR WITH VOLTAGE DETECTORS

## S-8310/8311 Series

Integration of the above equation is as follows:

$$I_L = I_{PK} - \left( \frac{V_{OUT} + V_D - V_{IN}}{L} \right) \cdot t \dots\dots\dots (7)$$

When M1 is turned ON ( $t_{ON}$ ), the energy is stored in L and is not transmitted to  $V_{OUT}$ . When receiving output current ( $I_{OUT}$ ) from  $V_{OUT}$ , the energy of the capacitor ( $C_{OUT}$ ) is consumed. As a result, the pin voltage of  $C_{OUT}$  is reduced, and goes to the lowest level after M1 is turned ON ( $t_{ON}$ ). When M1 is turned OFF, the energy stored in L is transmitted through the diode to  $C_{OUT}$ , and the voltage of  $C_{OUT}$  rises drastically.  $V_{OUT}$  is a time function that indicates the maximum value (ripple voltage  $V_{P-P}$ ) when the current flowing through the diode into  $V_{OUT}$  and load current ( $I_{OUT}$ ) match.

Next, the ripple voltage is found out as follows:

$I_{OUT}$  vs  $t_1$  (time) from when M1 is turned ON ( $t_{ON}$ ) to when  $V_{OUT}$  reaches the maximum level:

$$I_{OUT} = I_{PK} - \left( \frac{V_{OUT} + V_D - V_{IN}}{L} \right) \cdot t_1 \dots\dots\dots (8)$$

$$\therefore t_1 = (I_{PK} - I_{OUT}) \cdot \left( \frac{L}{V_{OUT} + V_D - V_{IN}} \right) \dots\dots\dots (9)$$

When M1 is turned OFF ( $t_{OFF}$ ),  $I_L = 0$  (when the energy of the inductor is completely consumed). Based on equation (7),

$$\left( \frac{L}{V_{OUT} + V_D - V_{IN}} \right) = \frac{t_{OFF}}{I_{PK}} \dots\dots\dots (10)$$

When substituting equation (10) for equation (9),

$$t_1 = t_{OFF} - \left( \frac{I_{OUT}}{I_{PK}} \right) \cdot t_{OFF} \dots\dots\dots (11)$$

Electric charge  $\Delta Q_1$  which is charged in  $C_{OUT}$  during  $t_1$ :

$$\begin{aligned} \Delta Q_1 &= \int_0^{t_1} I_L dt = I_{PK} \cdot \int_0^{t_1} dt - \frac{V_{OUT} + V_D - V_{IN}}{L} \cdot \int_0^{t_1} t dt \\ &= I_{PK} \cdot t_1 - \frac{V_{OUT} + V_D - V_{IN}}{L} \cdot \frac{1}{2} t_1^2 \dots\dots\dots (12) \end{aligned}$$

When substituting equation (9) for equation (12):

$$\Delta Q_1 = I_{PK} - \frac{1}{2} (I_{PK} - I_{OUT}) \cdot t_1 = \frac{I_{PK} + I_{OUT}}{2} \cdot t_1 \dots\dots\dots (13)$$

A rise in voltage ( $V_{P-P}$ ) due to  $\Delta Q_1$ :

$$V_{P-P} = \frac{\Delta Q_1}{C_{OUT}} = \frac{1}{C_{OUT}} \cdot \left( \frac{I_{PK} + I_{OUT}}{2} \right) \cdot t_1 \dots\dots\dots (14)$$

When taking into consideration  $I_{OUT}$  to be consumed during  $t_1$ :

$$V_{P-P} = \frac{\Delta Q_1}{C_{OUT}} = \frac{1}{C_{OUT}} \cdot \left( \frac{I_{PK} + I_{OUT}}{2} \right) \cdot t_1 - \frac{I_{OUT} \cdot t_1}{C_{OUT}} \dots\dots\dots (15)$$

When substituting equation (15) for equation (11):

$$V_{P-P} = \frac{(I_{PK} - I_{OUT})^2}{2 I_{PK}} \cdot \frac{t_{OFF}}{C_{OUT}} \dots\dots\dots (16)$$

Figure 4

**2. Voltage Detectors (VD1, VD2)**

The S-8310/8311 Series has two voltage detectors.

The power of the voltage detectors is supplied from  $V_{OUT}$ . When  $V_{OUT}$  is below the operating voltage  $V_{dd1}$  and  $V_{dd2}$ , the voltage detector does not function normally. The detectors function regardless of  $\overline{SD1}$  or  $\overline{SD2}$ .

Detector VD1 internally monitors the voltage of  $V_{OUT}$ . Detector VD2 can detect any voltage by connecting the SENSE terminal (see Figure 5). The VD1 detection voltage can be selected between 1.5V and 3.2V by 0.1V step. The VD2 detection voltage can be selected between 0.8V and 2.0V by 0.1V step.

Figure 5

**3. Voltage Clamp Circuit**

The built-in voltage clamp circuit in the S-8311 Series prevents a drop in the battery voltage caused by large current and internal resistance of the battery (clamp voltage), and controls the current flowing into a load. This prevents the step-up switching regulator from stopping. This clamp voltage can be set to the following equation by using the resistance values  $R1$  and  $R2$ . As shown in the circuit of Figure 6,  $V_{IN}$  does not drop below this clamp voltage. Always set  $R1 + R2$  below 1 M $\Omega$ .  $V_{clamp}$ , however, cannot be set below 0.9 V.

$$V_{clamp} = \frac{R1 + R2}{R2} \times V_{INREF}$$

The power of the voltage clamp circuit (Amp1) is supplied from  $V_{OUT}$ . According to the signal of  $\overline{SD2}$ , M2 is turned ON, M3, M4, and M5 are turned OFF, and Amp1 is turned OFF. The current does not flow into the circuit and its clamp operation stops. The standard voltage to Amp1 is obtained by dividing  $V_{OUT}$  voltage with resistors  $R3$  and  $R4$ . DO NOT use the  $\overline{SD2}$  terminal in floating state because of no internal pulling-up and -down.

When using a motor as a load, connect in parallel a capacitor  $C_L$  of 10  $\mu F$  or more to the load in order to ensure stable operation.

Figure 6

# PWM STEP-UP SWITCHING REGULATOR WITH VOLTAGE DETECTORS

## S-8310/8311 Series

Select a PNP transistor among transistors having the following characteristics:

- ①  $h_{EF} < 100$  or more ( $I_C = 100$  mA)
- ②  $V_{sat} < 0.15$  V ( $I_C = 100$  mA)

The 2SA1362GR or similar transistors are recommendable.

Figure 7 shows the characteristics of the M3 transistors's sink current.

Figure 7

### External Part Selection Guidelines

#### 1. Inductor

To minimize a loss due to inductor DC resistance, select an inductor with a resistance of less than 1  $\Omega$  DC. Set the inductance value from 47  $\mu$ H to 220  $\mu$ H.

To stabilize the output voltage ( $V_{OUT}$ ), it is necessary to supply the energy corresponding to the output current ( $I_{OUT}$ ) from the inductor. The amount of charge required for  $I_{OUT}$  is  $I_{OUT} \times (t_{ON} + t_{OFF})$ . Because the inductor cannot supply the energy except when M1 is turned OFF ( $t_{OFF}$ ), the charge is obtained by integrating equation (7) with  $0 \rightarrow t_{OFF}$ , namely,

$\frac{I_{PK}}{2} \cdot t_{OFF}$ . Thus,

$$\frac{I_{PK}}{2} \cdot t_{OFF} = I_{OUT} \times (t_{ON} + t_{OFF}) \dots\dots\dots (17)$$

$$\therefore I_{PK} = 2 \cdot \frac{t_{ON} + t_{OFF}}{t_{OFF}} \cdot I_{OUT} \dots\dots\dots (18)$$

When the duty ratio of the OSC is 75%,  $I_{PK} = 8 \cdot I_{OUT}$ . Therefore, an  $I_{PK}$  current 8 times as higher than  $I_{OUT}$  flows into transistor M1. The S-8310/11 Series, however, includes a switching circuit that controls the current flowing through CONT in order to prevent the IC from being broken due to the excess current. The current limit value is internally set to approximately 320 mA.

When selecting an inductor with a large value of L, both  $I_{PK}$  and  $I_{OUT}$  decrease. With the energy stored in the inductor is equal to  $\frac{1}{2} L \cdot (I_{PK})^2$ , even if L becomes large, the energy still decreases because  $I_{PK}$  is squared. As a result, step-up at low voltage becomes difficult and the start-up voltage becomes high. However, with DC resistance loss in L and the M1 transistor reduced by only the decrease in  $I_{PK}$ , inductance efficiency improves.

On the other hand, when selecting an inductor with a small value of L, both  $I_{PK}$  and  $I_{OUT}$  increase. The start-up voltage decreases. The inductance efficiency, however, worsens.

【 CAUTION 】 An excess increase in  $I_{PK}$  may decrease efficiency drastically due to magnetic saturation depending upon a core material. Use a core material that ensures  $I_{sat} > I_{PK}$  ( $I_{sat}$ : current causing magnetic saturation).

## 2. Diode

Use an external diode that can meet the following requirements:

- Low forward voltage ( $V_F < 0.3V$ )
- High switching speed (500 ns max.)
- Reverse voltage:  $V_{OUT} + V_F$  or more
- Rated current:  $I_{PK}$  or more

## 3. Capacitors ( $C_{IN}$ , $C_{OUT}$ )

Mounting a capacitor at the input side ( $C_{IN}$ ) can improve the efficiency, reduce the power impedance and stabilize the input current. Select a value of  $C_{IN}$  according to the impedance of the power supply you use and set the value of the capacitor to approximately 10  $\mu F$ .

The capacitor mounted at the output side ( $C_{OUT}$ ) is used for smoothing the ripple voltage. Select a capacitor with small ESR (Electric Series Resistance) and large capacitance. Set the value of the capacitor to approximately 10  $\mu F$ . We recommend you use a tantalum electrolytic capacitor or an organic semiconductor capacitor which is superior in temperature and leakage current characteristics.

# PWM STEP-UP SWITCHING REGULATOR WITH VOLTAGE DETECTORS

## S-8310/8311 Series

### Standard Circuit

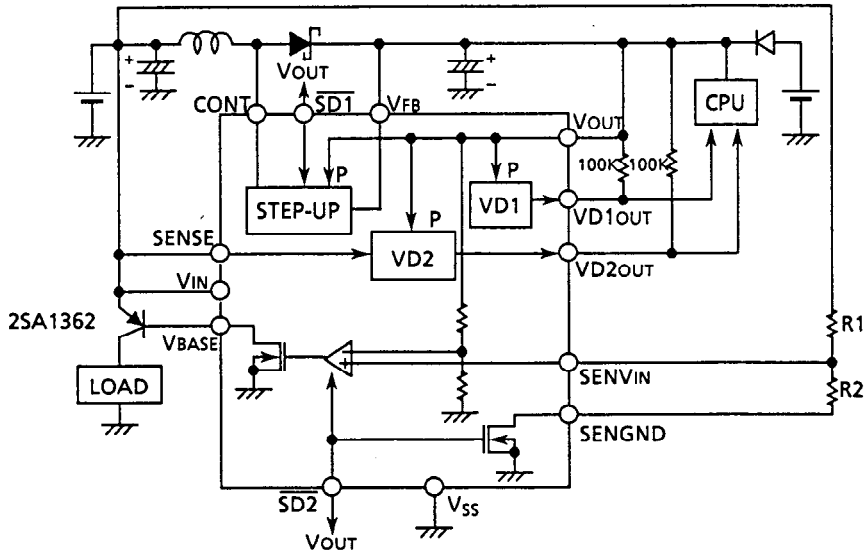

Figure 8

Note: To decrease the ripple voltage at  $V_{OUT}$  terminal, insert a  $\pi$ -type filter between  $V_{FB}$  and  $V_{OUT}$ . When  $V_{OUT}$  voltage approximates to detection voltage  $VD1$ ,  $VD1$  may be detected due to the ripple voltage. Be careful!!

Figure 9

### Precautions

- Mount external capacitors, a diode, and a coil nearest to the IC. Always set wiring resistance between the positive terminal of the capacitor (which is connected to  $V_{OUT}$  terminal) and  $V_{OUT}$  terminal of the IC to less than  $0.2 \Omega$ . Also, ensure the wiring length of 2 cm or less. If impossible, set a  $0.1 \mu F$  ceramic capacitor to  $V_{OUT}$  terminal as near as possible.
- Ripple voltage or spike noise may ordinarily occur in switching regulators. Check it using an actually mounted model.
- Seiko Instruments Inc. is not responsible for any problems caused by circuits or other diagrams described herein whose industrial properties, patents or other rights belong to third parties.
- Make sure a loss (especially at high temperatures) in the switching transistor does not exceed the package power dissipation.
