

STK10C68-M

CMOS nvSRAM

High Performance

8K x 8 Nonvolatile Static RAM

MIL-STD-833/SMD 5962 - 93056

FEATURES

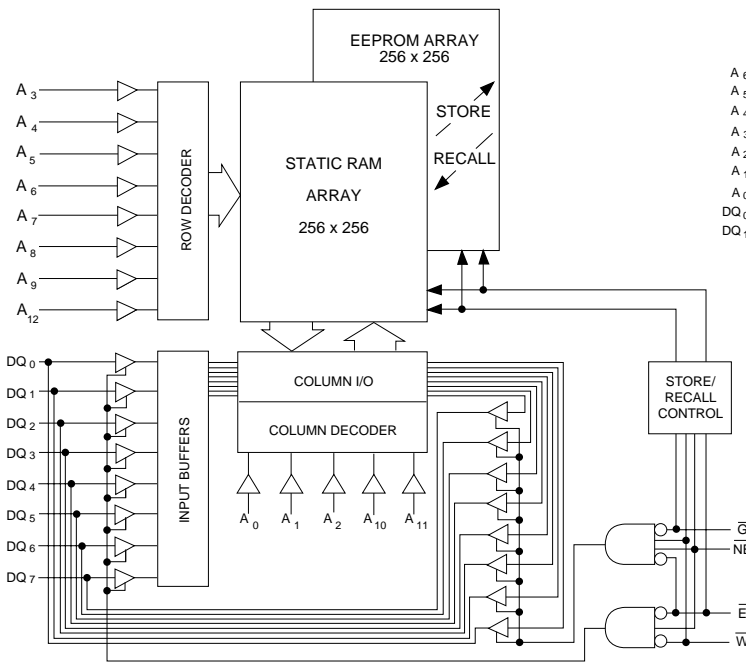

- 35, 45 and 55ns Access Times
- 20 and 25ns Output Enable Access
- Unlimited Read and Write to SRAM
- Hardware *STORE* Initiation
- Automatic *STORE* Timing
- 100,000 *STORE* cycles to EEPROM
- 10 year data retention in EEPROM
- Automatic *RECALL* on Power Up
- Hardware *RECALL* Initiation
- Unlimited *RECALL* cycles from EEPROM
- Single 5V±10% Operation
- Available in multiple standard packages

DESCRIPTION

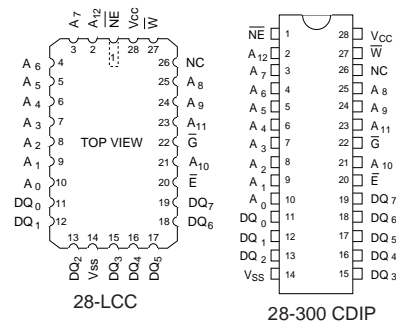

The Simtek STK10C68-M is a fast static RAM (35, 45 and 55ns), with a nonvolatile electrically-erasable PROM (EEPROM) element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent nonvolatile data resides in EEPROM. Data may easily be transferred from the SRAM to the EEPROM (*STORE*), or from the EEPROM to the SRAM (*RECALL*) using the \overline{NE} pin. It combines the high performance and ease of use of a fast SRAM with nonvolatile data integrity.

The STK10C68 features industry standard pinout for nonvolatile RAMs in a 28-pin 300 mil ceramic DIP, and 28-pad LCC packages. Commercial and industrial temperature devices are also available.

LOGIC BLOCK DIAGRAM

PIN CONFIGURATIONS

PIN NAMES

Pin Name	Function
A ₀ - A ₁₂	Address Inputs
\overline{W}	Write Enable
DQ ₀ - DQ ₇	Data In/Out
\overline{E}	Chip Enable
\overline{G}	Output Enable
\overline{NE}	Nonvolatile Enable
V _{CC}	Power (+5V)
V _{SS}	Ground

STK10C68-M

ABSOLUTE MAXIMUM RATINGS^a

Voltage on typical input relative to V_{SS}	-0.6V to 7.0V
Voltage on DQ_{0-7} and \bar{G}	-0.5V to $(V_{CC}+0.5V)$
Temperature under bias	-55°C to 125°C
Storage temperature.	-65°C to 150°C
Power dissipation.	1W
DC output current	15mA

(One output at a time, one second duration)

Note a: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC CHARACTERISTICS

($V_{CC} = 5.0V \pm 10\%$)

SYMBOL	PARAMETER	MIN	MAX	UNITS	NOTES
I_{CC1}^b	Average V_{CC} Current		90 85 80	mA	$t_{AVAV} = 35ns$ $t_{AVAV} = 45ns$ $t_{AVAV} = 55ns$
I_{CC2}^d	Average V_{CC} Current during <i>STORE</i> cycle		50	mA	$\bar{E} \geq (V_{CC} - 0.2V)$ all others $V_{IN} \leq 0.2V$ or $\geq (V_{CC} - 0.2V)$
I_{SB1}^c	Average V_{CC} Current (Standby, Cycling TTL Input Levels)		27 23 20	mA	$t_{AVAV} = 35ns$ $t_{AVAV} = 45ns$ $t_{AVAV} = 55ns$ $\bar{E} \geq V_{IH}$; all others cycling
I_{SB2}^c	Average V_{CC} Current (Standby, Stable CMOS Input Levels)		2	mA	$\bar{E} \geq (V_{CC} - 0.2V)$ all others $V_{IN} \leq 0.2V$ or $\geq (V_{CC} - 0.2V)$
I_{ILK}	Input Leakage Current (Any Input)		± 1	μA	$V_{CC} = \max$ $V_{IN} = V_{SS}$ to V_{CC}
I_{OLK}	Off State Output Leakage Current		± 5	μA	$V_{CC} = \max$ $V_{IN} = V_{SS}$ to V_{CC}
V_{IH}	Input Logic "1" Voltage	2.2	$V_{CC}+5$	V	All Inputs
V_{IL}	Input Logic "0" Voltage	$V_{SS}-5$	0.8	V	All Inputs
V_{OH}	Output Logic "1" Voltage	2.4		V	$I_{OUT} = -4mA$
V_{OL}	Output Logic "0" Voltage		0.4	V	$I_{OUT} = 8mA$
T_A	Operating Temperature	-55	125	°C	

Note b: I_{CC1} is dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.

Note c: Bringing $\bar{E} \geq V_{IH}$ will not produce standby current levels until any nonvolatile cycle in progress has timed out. See MODE SELECTION table.

Note d: I_{CC2} is the average current required for the duration of the store cycle (t_{STORE}) after the sequence (t_{WC}) that initiates the cycle.

AC TEST CONDITIONS

Input Pulse Levels.	V_{SS} to 3V
Input Rise and Fall Times.	$\leq 5ns$
Input and Output Timing Reference Levels.	1.5V
Output Load.	See Figure 1

CAPACITANCE^e ($T_A=25^\circ C, f=1.0MHz$)

SYMBOL	PARAMETER	MAX	UNITS	CONDITIONS
C_{IN}	Input Capacitance	5	pF	$\Delta V = 0$ to 3V
C_{OUT}	Output Capacitance	7	pF	$\Delta V = 0$ to 3V

Note e: These parameters are guaranteed but not tested.

L	L	L	L	No operation	Active
L	H	H	X		

STORE CYCLES #1 & #2

($V_{CC} = 5.0V \pm 10\%$)

NO.	SYMBOLS			PARAMETER	MIN	MAX	UNITS
	#1	#2	Alt.				
22	t_{WLOX}^p	t_{ELQXS}	t_{STORE}	STORE Cycle Time		12	ms
23	t_{WLNH}^q	t_{ELNHS}	t_{WC}	STORE Initiation Cycle Time	35		ns
24	t_{GHNL}			Output Disable Set-up to \bar{NE} Fall	0		ns
25		t_{GHLE}		Output Disable Set-up to \bar{E} Fall	0		ns
26	t_{NLWL}	t_{NLEL}		\bar{NE} Set-up	0		ns
27	t_{ELWL}			Chip Enable Set-up	0		ns
28		t_{WLEL}		Write Enable Set-up	0		ns

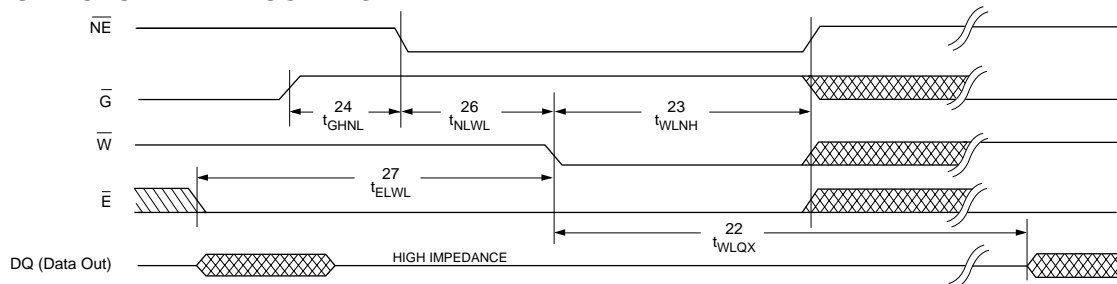

Note n: An automatic *RECALL* also takes place at power up, starting when V_{CC} exceeds 4.0V, and taking t_{RECALL} from the time at which V_{CC} exceeds 4.5V. V_{CC} must not drop below 4.0V once it has been exceeded for the *RECALL* to function properly.

Note o: If \bar{E} is low for any period of time in which \bar{W} is high and \bar{G} and \bar{NE} are low, then a *RECALL* cycle may be initiated.

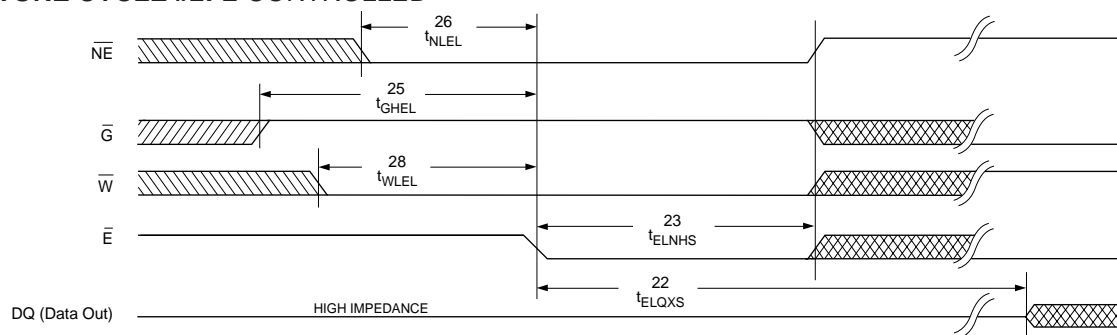

Note p: Measured with \bar{W} and \bar{NE} both returned high, and \bar{G} returned low. Note that *STORE* cycles are inhibited/aborted by $V_{CC} < 4.0V$ (*STORE* inhibit).

Note q: Once t_{WC} has been satisfied by \bar{NE} , \bar{G} , \bar{W} and \bar{E} , the *STORE* cycle is completed automatically. Any of \bar{NE} , \bar{G} , \bar{W} or \bar{E} may be used to terminate the *STORE* initiation cycle.

STORE CYCLE #1: \bar{W} CONTROLLED^o

STORE CYCLE #2: \bar{E} CONTROLLED^o

RECALL CYCLES #1, #2 & #3

(V_{CC} = 5.0V ± 10%)

NO.	SYMBOLS			PARAMETER	MIN	MAX	UNITS
	#1	#2	#3

33	t _{WHNL}	t _{WHEL}	t _{WHGL}	Write Enable Set-up	0		ns
34	t _{ELNL}		t _{ELGL}	Chip Enable Set-up	0		ns
35	t _{NLQZ}			\overline{NE} Fall to Outputs Inactive		35	ns

Note r: Measured with \overline{W} and \overline{NE} both high, and \overline{G} and \overline{E} low.

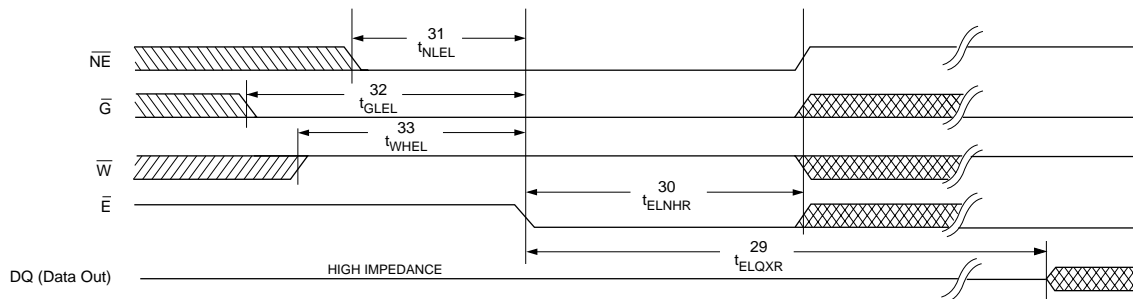

Note s: Once t_{NLNH} has been satisfied by \overline{NE} , \overline{G} , \overline{W} and \overline{E} , the RECALL cycle is completed automatically. Any of \overline{NE} , \overline{G} or \overline{E} may be used to terminate the RECALL initiation cycle.

Note t: If \overline{W} is low at any point in which both \overline{E} and \overline{NE} are low and \overline{G} is high, then a STORE cycle will be initiated instead of a RECALL.

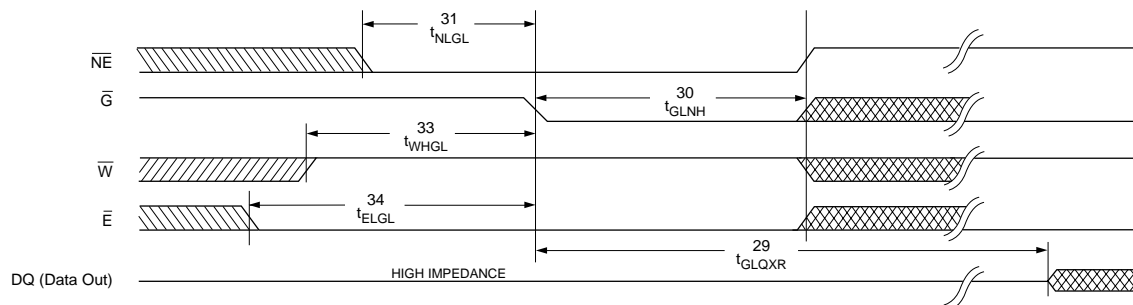

RECALL CYCLE #1: \overline{NE} CONTROLLED^o

RECALL CYCLE #2: \overline{E} CONTROLLED^o

RECALL CYCLE #3: \overline{G} CONTROLLED^{o,t}

DEVICE OPERATION

The STK10C68-M has two modes of operation: SRAM mode and nonvolatile mode, determined by the state of the \overline{NE} pin. When in SRAM mode, the memory operates as a standard fast static RAM. While in nonvolatile mode, data is transferred in parallel from SRAM to EEPROM or from EEPROM to SRAM.

SRAM READ

The STK10C68-M performs a READ cycle whenever \overline{E} and \overline{G} are LOW and \overline{NE} and \overline{W} are HIGH. The address specified on pins A_{0-12} determines which of the 8192 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t_{AVQV} (READ CYCLE #1). If the READ is initiated by \overline{E} or \overline{G} , the outputs will be valid at t_{ELQV} or at t_{GLQV} , whichever is later (READ CYCLE #2). The data outputs will repeatedly respond to address changes within the t_{AVQV} access time without the need for transitions on any control input pins, and will remain valid until another address change or until \overline{E} or \overline{G} is brought HIGH or \overline{W} or \overline{NE} is brought LOW.

The STK10C68-M is a high speed memory and therefore must have a high frequency bypass capacitor of approximately 0.1 μ F connected between DUT V_{CC} and V_{SS} using leads and traces that are as short as possible. As with all high speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

SRAM WRITE

A write cycle is performed whenever \overline{E} and \overline{W} are LOW and \overline{NE} is HIGH. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either \overline{E} or \overline{W} go HIGH at the end of the cycle. The data on pins DQ_{0-7} will be written into the memory if it is valid t_{DVWH} before the end of a \overline{W} controlled WRITE or t_{DVEH} before the end of an \overline{E} controlled WRITE.

It is recommended that \overline{G} be kept HIGH during the entire WRITE cycle to avoid data bus contention on common I/O lines. If \overline{G} is left LOW, internal circuitry will turn off the output buffers t_{WLQZ} after \overline{W} goes LOW.

NONVOLATILE STORE

A STORE cycle is performed when \overline{NE} , \overline{E} and \overline{W} are

LOW and \overline{G} is HIGH. While any sequence to achieve this state will initiate a STORE, only \overline{W} initiation (STORE CYCLE #1) and \overline{E} initiation (STORE CYCLE #2) are practical without risking an unintentional SRAM WRITE that would disturb SRAM data. During a STORE cycle, previous nonvolatile data is erased and the SRAM contents are then programmed into nonvolatile elements. Once a STORE cycle is initiated, further input and output is disabled and the DQ_{0-7} pins are tri-stated until the cycle is completed.

If \overline{E} and \overline{G} are LOW and \overline{W} and \overline{NE} are HIGH at the end of the cycle, a READ will be performed and the outputs will go active, signaling the end of the STORE.

HARDWARE PROTECT

The STK10C68-M offers two levels of protection to suppress inadvertent STORE cycles. If the control signals (\overline{E} , \overline{G} , \overline{W} , and \overline{NE}) remain in the STORE condition at the end of a STORE cycle, a second STORE cycle will *not* be started. The STORE (or RECALL) will be initiated only after a transition on any one of these signals to the required state. In addition to multi-trigger protection, the STK10C68-M offers hardware protection through V_{CC} Sense. A STORE cycle will not be initiated, and one in progress will discontinue, if V_{CC} goes below 4.0V. 4.0V is a typical, characterized value.

NONVOLATILE RECALL

A RECALL cycle is performed when \overline{E} , \overline{G} , and \overline{NE} are LOW and \overline{W} is HIGH. Like the STORE cycle, RECALL is initiated when the last of the four clock signals goes to the RECALL state. Once initiated, the RECALL cycle will take t_{NLQX} to complete, during which all inputs are ignored. When the RECALL completes, any READ or WRITE state on the input pins will take effect.

Internally, RECALL is a two step procedure. First, the SRAM data is cleared and second, the nonvolatile information is transferred into the SRAM cells. The RECALL operation in no way alters the data in the nonvolatile cells. The nonvolatile data can be recalled an unlimited number of times.

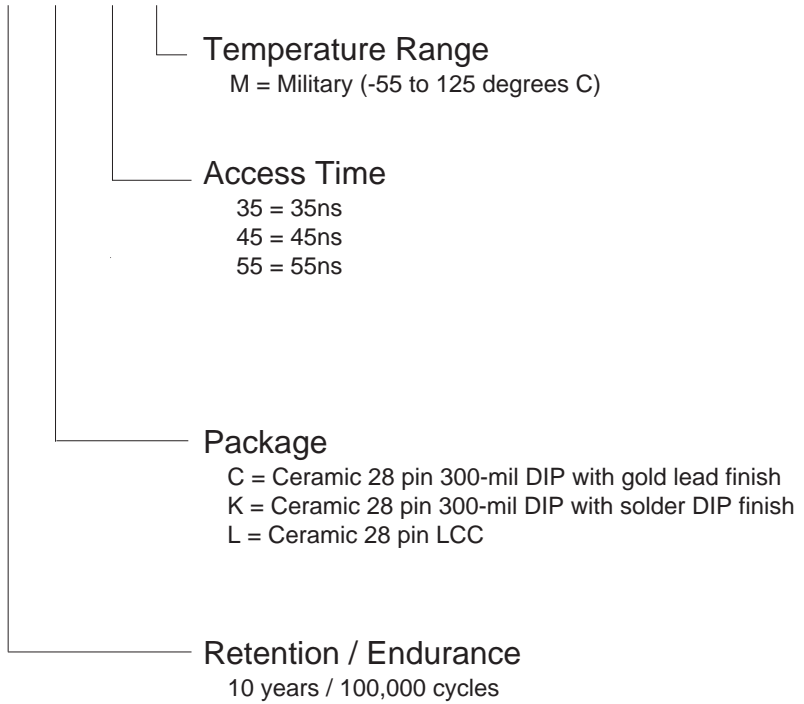

Like the *STORE* cycle, a transition must occur on some control pin to cause a recall, preventing inadvertent multi-triggering. On power-up, once V_{CC} exceeds the V_{CC} sense voltage of 4.0V, a *RECALL* cycle is automatically initiated. The voltage on the V_{CC} pin must not drop below 4.0V once it has risen above it in order for the *RECALL* to operate properly. Due to this automatic

RECALL, SRAM operation cannot commence until t_{NLQX} after V_{CC} exceeds 4.0V. 4.0V is a typical, characterized value.

If the STK10C68-M is in a WRITE state at the end of power-up *RECALL*, the SRAM data will be corrupted. To help avoid this situation, a 10K Ohm resistor should be connected between \bar{W} and system V_{CC} .
