## DC-TO-DC CONVERTER CONTROL CIRCUITS

The SL34063A is a monolithic control circuit containing the primary functions required for DC-to-DC converters. These devices consist of an internal temperature compensated reference, comparator, controlled duty cycle oscillator with an active current limit circuit, driver and high current output switch. This series was specifically designed to be incorporated in Step-Down and Step-Up and Voltage-Inverting applications with a minimum number of external components.

## FEATURES

- Operation from 3.0 V to 40 V Input
- Low Standby Current
- Current Limiting
- Output Switch Current to 1.5 A
- Output Voltage Adjustable
- Frequency Operation to 100 kHz
- Precision 2\% Reference

## NOTES:

1. Maximum package power dissipation limits must be observed.
2.Low duty cycle pulse techniques are used during test to maintain Junction temperature as close to ambient temperature as possible
3.If the output switch is driven into hard saturation (non Darlington configuration) at low switch currents (<300 mA) and high driver currents ( $>30 \mathrm{~mA}$ ), it may take up to $2.0 \mu \mathrm{~s}$ to come out of saturation This condition will shorten the off' time at frequencies $>30 \mathrm{kHz}$, and is magnified at high temperatures This condition does not occur with a Darlington configuration, since the output switch cannot saturate If a non Darlington configuration is used, the following output drive condition is recommended
Forced $\beta$ of output switch $=\mathrm{I}_{\mathrm{C}}$, output/(Ic, driver $\left.-7.0 \mathrm{~mA}^{*}\right)>10$
*The $100 \Omega$. resistor in the emitter of the driver device requires about 7.0 mA before the output switch conducts
