*1: V_{IN(max)} and I_{O(max)} are restricted by the relation P_{D(max)}=(V_{IN}-V_O)•I_O=14(W).

*2: Refer to the dropout voltage.(Refer to Setting DC Input Voltage on page 7.)

*3: I_{S1} is specified at -5(%) drop point of output voltage V_O on the condition that V_{IN}=V_O+3V, I_O=0.2A.

*4: A foldback type overcurrent protection circuit is built into the IC regulator. Therefore, avoid using it for the following applications as it may cause starting errors:

- (1) Constant current load (2) Plus/minus power (3) Series power (4) V_O adjustment by raising ground voltage

*5: Output is ON even when output control terminal V_C is open. Each input level is equivalent to LS-TTL. Therefore, it may be directly driven by an LS-TTL circuit.

*6. When setting output voltage to 5V or less, input voltage needs to be set to 6V or over to operate stably.

■Standard External Circuit

C_0 : Output capacitor (47 to 100 μ F)
 *1 C_1 } Oscillation prevention capacitor
 C_2 } (C_1 : Approx. 47 μ F, C_2 : 0.33 μ F)

These capacitors are required if the input line is inductive and in the case of long wiring. Tantalum capacitors are recommended for C_1 and C_0 , particularly at low temperatures.

*2 D_1 : Protection diode

This diode is required for protection against reverse biasing of the input and output. Sanken EU2Z is recommended.

*3 R_1 } External resistor for setting output voltage

R_2 } Relationship between output voltage V_o and external resistors R_1 and R_2 is as follows.

$$V_o = V_{REF} \cdot \left(1 + \frac{R_1}{R_2} \right) \quad (V_{REF} = 2.55V(\text{typ.}))$$

R_2 must be 2.55k Ω for stable operation.

■ T_a - P_d Characteristics

$$P_d = I_o \cdot [V_{IN}(\text{mean}) - V_o]$$

Note on Thermal Protection:

The thermal protection circuit is intended for protection against heat during instantaneous short-circuiting. Its operation is not guaranteed for short-circuiting over extended periods of time.
