

8-bit 50MSPS Video A/D Converter with Clamp Function

Description

The CXD2302Q is an 8-bit CMOS A/D converter for video with synchronizing clamp function. The adoption of 2 step-parallel method achieves low power consumption and a maximum conversion rate of 50MSPS.

Features

- Resolution: 8 bit $\pm 1/2$ LSB (DL)
- Maximum sampling frequency: 50MSPS
- Low power consumption: 125mW (at 50MSPS typ.) (reference current excluded)
- Synchronizing clamp function
- Clamp ON/OFF function
- Reference voltage self-bias circuit
- Input CMOS/TTL compatible
- 3-state TTL compatible output
- Single 5V power supply or dual 5V/3.3V power supply
- Low input capacitance: 15pF
- Reference impedance: 370 Ω (typ.)

Applications

Wide range of applications that require high-speed A/D conversion such as TV and VCR.

Structure

Silicon gate CMOS IC

Absolute Maximum Ratings (Ta = 25°C)

- Supply voltage V_{DD} 7 V
- Reference voltage V_{RT}, V_{RB} $V_{DD} + 0.5$ to $V_{SS} - 0.5$ V
- Input voltage V_{IN} $V_{DD} + 0.5$ to $V_{SS} - 0.5$ V (Analog)
- Input voltage V_I $V_{DD} + 0.5$ to $V_{SS} - 0.5$ V (Digital)
- Output voltage V_O $V_{DD} + 0.5$ to $V_{SS} - 0.5$ V (Digital)
- Storage temperature T_{stg} -55 to +150 °C

Recommended Operating Conditions

- Supply voltage AV_{DD}, AV_{SS} 4.75 to 5.25 V
- DV_{DD}, DV_{SS} 3.0 to 5.5 V
- $|DV_{SS} - AV_{SS}|$ 0 to 100 mV
- Reference input voltage V_{RB} 0 and above V
- V_{RT} 2.7 and below V
- Analog input V_{IN} 1.7Vp-p above
- Clock pulse width $TPW1, TPW0$ 9ns (min) to 1.1 μ s (max)
- Operating ambient temperature T_{opr} -40 to +85 °C

Block Diagram

Pin Description

Pin No.	Symbol	Equivalent circuit	Description
1 to 8	D ₀ to D ₇		D ₀ (LSB) to D ₇ (MSB) output
9	TEST		Leave open for normal use.
10	DV _{DD}		Digital power supply +5V or +3.3V
11	TEST		Leave open for normal use. Pull-up resistor is built in.
15	CLP		Input the clamp pulse. Clamps the signal voltage during Low interval. Pull-up resistor is built in.
29	$\overline{\text{CLE}}$		The clamp function is enabled when CLE = Low. The clamp function is set to off and the converter functions as a normal A/D converter when CLE = High. Pull-up resistor is built in.
12	CLK		Clock input. Set to Low level when no clock is input.
13, 14, 32	NC		
16, 19, 20	AV _{DD}		Analog power supply +5V

Pin No.	Symbol	Equivalent circuit	Description
17	VRTS		Generates approximately +2.5V when shorted with AVDD.
18	VRT		Reference voltage (top)
24	VRB		Reference voltage (bottom)
25	VRBS		Generates approximately +0.6V when shorted with AVSS.
21	VIN		Analog input
22, 23	AVss		Analog ground
26	VREF		Clamp reference voltage input. Clamps so that the reference voltage and the input signal during clamp interval are equal.
27	CCP		Integrates the clamp control voltage. The relationship between the changes in CCP voltage and in VIN voltage is positive phase.
28, 31	DVss		Digital ground
30	\overline{OE}		Data is output when \overline{OE} = Low. Pins D0 to D7 are at high impedance when \overline{OE} = High. Pull-down resistor is built in.

Digital output

The following table shows the relationship between analog input voltage and digital output code.

Input signal voltage	Step	Digital output code	
		MSB	LSB
V_{RT}	0	1 1 1 1 1 1 1 1	
⋮	⋮	⋮	
⋮	127	1 0 0 0 0 0 0 0	
⋮	128	0 1 1 1 1 1 1 1	
⋮	⋮	⋮	
V_{RB}	255	0 0 0 0 0 0 0 0

		FIN = 1MHz			49		
		FIN = 3MHz			46		
		FIN = 10MHz			45		
		FIN = 25MHz			45		

*1 The offset voltage EOB is a potential difference between VRB and a point of position where the voltage drops equivalent to 1/2 LSB of the voltage when the output data changes from "00000000" to "00000001".
EOT is a potential difference between VRT and a potential of point where the voltage rises equivalent to 1/2LSB of the voltage when the output data changes from "11111111" to "11111110".

*2 Clamp offset voltage varies individually. When using with R, G, B 3 channels, color sliding may be generated.

DC characteristics (F_C = 50MHz, AV_{DD} = 5V, DV_{DD} = 5V or 3.3V, V_{RB} = 0.5V, V_{RT} = 2.5V, Ta = 25°C)

Item	Symbol	Conditions		Min.	Typ.	Max.	Unit
Supply current	I _{AD} + I _{DD}	NTSC ramp wave input C $\overline{\text{LE}}$ = 0V	DV _{DD} = 5V		25	36	mA

	C _{DIN}	TEST, CLK, CLP, C $\overline{\text{LE}}$, O $\overline{\text{E}}$				11	
Output capacitance	C _{AO}	CCP				11	pF
	C _{DO}	D0 to D7, TEST				11	
Digital input voltage	V _{IH}	AV _{DD} = 4.75 to 5.25V DV _{DD} = 3 to 5.5V Ta = -40 to +85°C		2.2			V
	V _{IL}					0.8	
Digital input current	I _{IH} I _{IL}	V _I = 0V to AV _{DD} Ta = -40 to +85°C	CLK	-240		240	μA
			TEST, CLP, C $\overline{\text{LE}}$	-240		40	
			O $\overline{\text{E}}$	-40		240	
Digital output current	I _{OH}	O $\overline{\text{E}}$ = 0V DV _{DD} = 5V Ta = -40 to +85°C	V _{OH} = DV _{DD} - 0.8V			-2	mA
	I _{OL}		V _{OL} = 0.4V	4			
	I _{OH}	O $\overline{\text{E}}$ = 0V DV _{DD} = 3.3V Ta = -40 to +85°C	V _{OH} = DV _{DD} - 0.8V			-1.2	mA
	I _{OL}		V _{OL} = 0.4V	2.4			
	I _{OZH}	O $\overline{\text{E}}$ = 3V DV _{DD} = 3 to 5.5V Ta = -40 to +85°C	V _{OH} = DV _{DD}	-40		40	μA
	I _{OZL}		V _{OL} = 0V	-40		40	

Note) The voltage of up to (AV_{DD} + 0.5V) can be input when DV_{DD} = 3.3V. But the output pin voltage is less than the DV_{DD} voltage. When the digital output is in the high impedance mode, the IC may be damaged by applying the voltage which is more than the (DV_{DD} + 0.5V) voltage to the digital output.

Timing (F_C = 50MHz, AV_{DD} = 5V, DV_{DD} = 5V or 3.3V, V_{RB} = 0.5V, V_{RT} = 2.5V, T_a = 25°C)

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit	
Output data delay	t _{pLH}	C _L = 15pF OE = 0V	DV _{DD} = 5V	5.5	9.5	12.0	ns
	t _{pHL}			8.5	11.8		
	t _{pLH}		DV _{DD} = 3.3V	4.3	7.6	16.3	
	t _{pHL}			7.6	11.8		
Tri-state output enable time	t _{pZH}	R _L = 1kΩ C _L = 15pF OE = 3V → 0V	DV _{DD} = 5V	2.5	4.5	8.0	ns
	t _{pZL}			6.0	7.0		
	t _{pZH}		DV _{DD} = 3.3V	3.0	5.0	9.0	
	t _{pZL}			5.0	7.0

Timing Chart II

Operation (See Block Diagram and Timing Chart II)

1. The CXD2302Q is a 2-step parallel system A/D converter featuring a 4-bit upper comparator block and 2 lower comparator blocks of 4-bit each. The reference voltage that is equal to the voltage between $V_{RT} - V_{RB}/16$ is constantly applied to the upper 4-bit comparator block. Voltage that corresponded to the upper data is fed through the reference supply to the lower 4-bit comparator block. V_{RTS} and V_{RBS} pins serve for the self generation of V_{RT} (Reference voltage top) and V_{RB} (Reference voltage bottom), and they are also used as the sense pins as shown in the Application Circuit examples I-4 and I-5.

2. This IC uses an offset cancel type comparator which operates synchronously with an external clock. It features the following operating modes which are respectively indicated on the timing chart II with S, H, C symbols. That is input sampling (auto zero) mode, input hold mode and comparison mode.
3. The operation of respective parts is as indicated in the Timing Chart II. For instance input voltage V_i (1) is sampled with the falling edge of the external clock (1) by means of the upper comparator block and the lower comparator A block.
The upper comparator block finalizes comparison data MD (1) with the rising edge of the external clock (2). Simultaneously the reference supply generates the lower reference voltage RV (1) that corresponded to the upper results. The lower comparator A block finalizes comparison data LD (1) with the rising edge of the external clock (3). MD (1) and LD (1) are combined and output as Out (1) with the rising edge of the external clock (4). Accordingly there is a 2.5 clock delay from the analog input sampling point to the digital data output.

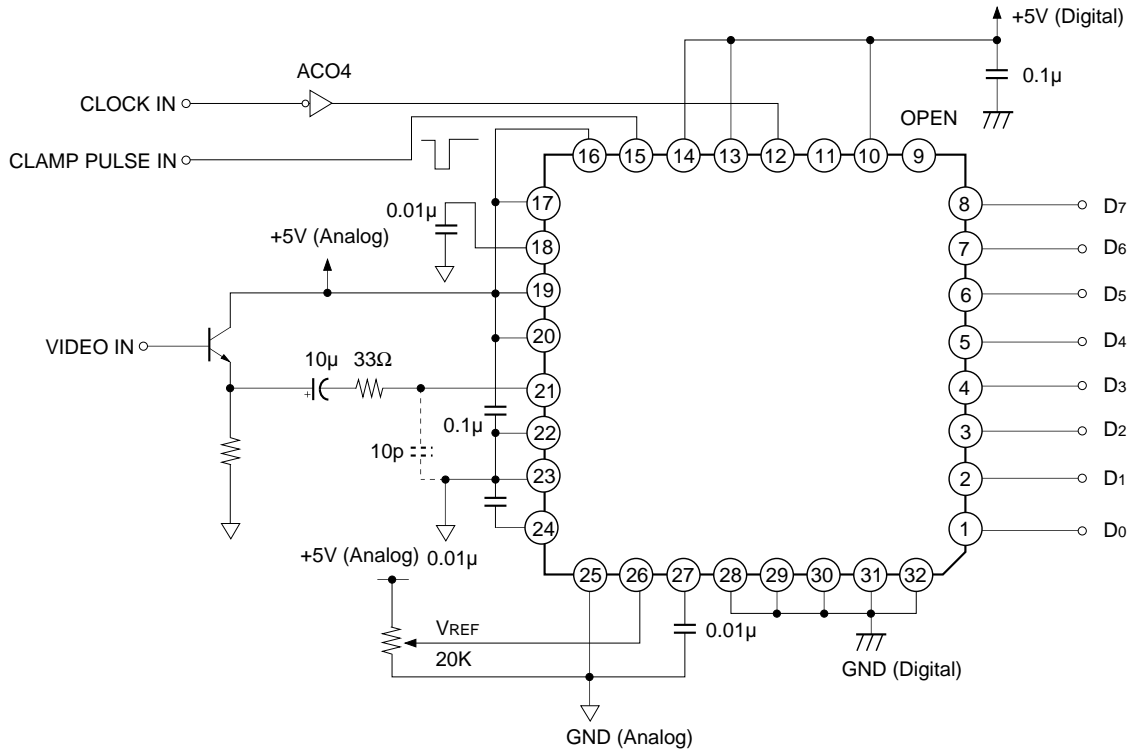

Operation Notes

1. V_{DD} , V_{SS}
To reduce noise effects, separate the analog and digital systems close to the device. For both the digital and analog V_{DD} pins, use a ceramic capacitor of about $0.1\mu\text{F}$ set as close as possible to the pin to bypass to the respective GND's.
2. Analog input
Compared with the flash type A/D converter, the input capacitance of the analog input is rather small. However it is necessary to conduct the drive with an amplifier featuring sufficient band and drive capability. When driving with an amplifier of low output impedance, parasitic oscillation may occur. That may be prevented by insetting a resistance of about 33Ω in series between the amplifier output and A/D input. When the V_{IN} signal of pin No. 21 is monitored, the kickback noise of clock is. However, this has no effect on the characteristics of A/D conversion.
3. Clock input
The clock line wiring should be as short as possible also, to avoid any interference with other signals, separate it from other circuits.
4. Reference input
Voltage V_{RT} to V_{RB} is compatible with the dynamic range of the analog input. Bypassing V_{RT} and V_{RB} pins to GND, by means of a capacitor about $0.1\mu\text{F}$, stable characteristics are obtained. By shorting V_{DD} and V_{RTS} , V_{SS} and V_{RBS} respectively, the self-bias function that generates V_{RT} =about 2.5V and V_{RB} =about 0.6V, is activated.
5. Timing
Analog input is sampled with the falling edge of CLK and output as digital data synchronized with a delay of 2.5 clocks and with the following rising edge. The delay from the clock rising edge to the data output is about 9ns ($DV_{DD} = 5V$).
6. \overline{OE} pin
Pins 1 to 8 (D_0 to D_7) are in the output mode by leaving \overline{OE} open or connecting it to DV_{SS} , and they are in the high impedance mode by connecting it to DV_{DD} .

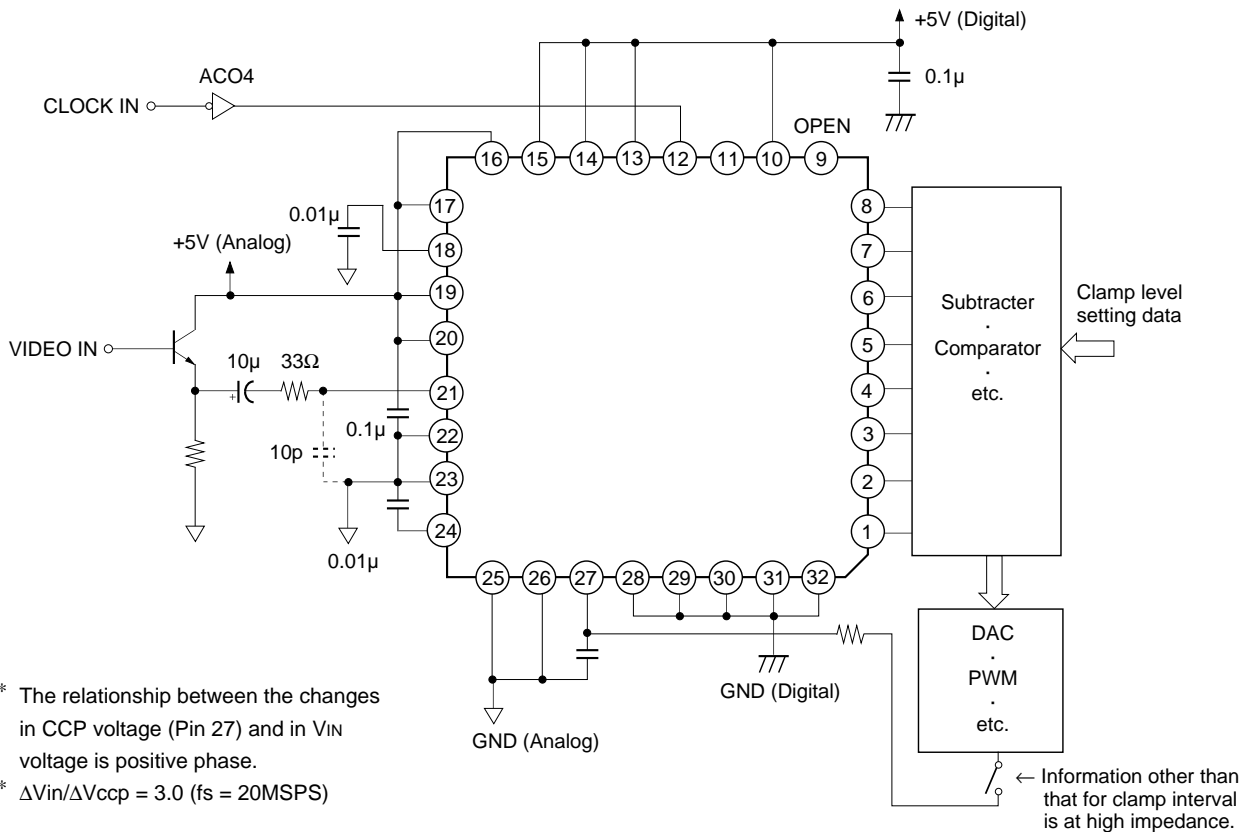

Application Circuit

I. Single +5V Power Supply

I-1. When clamp is used (self-bias used)

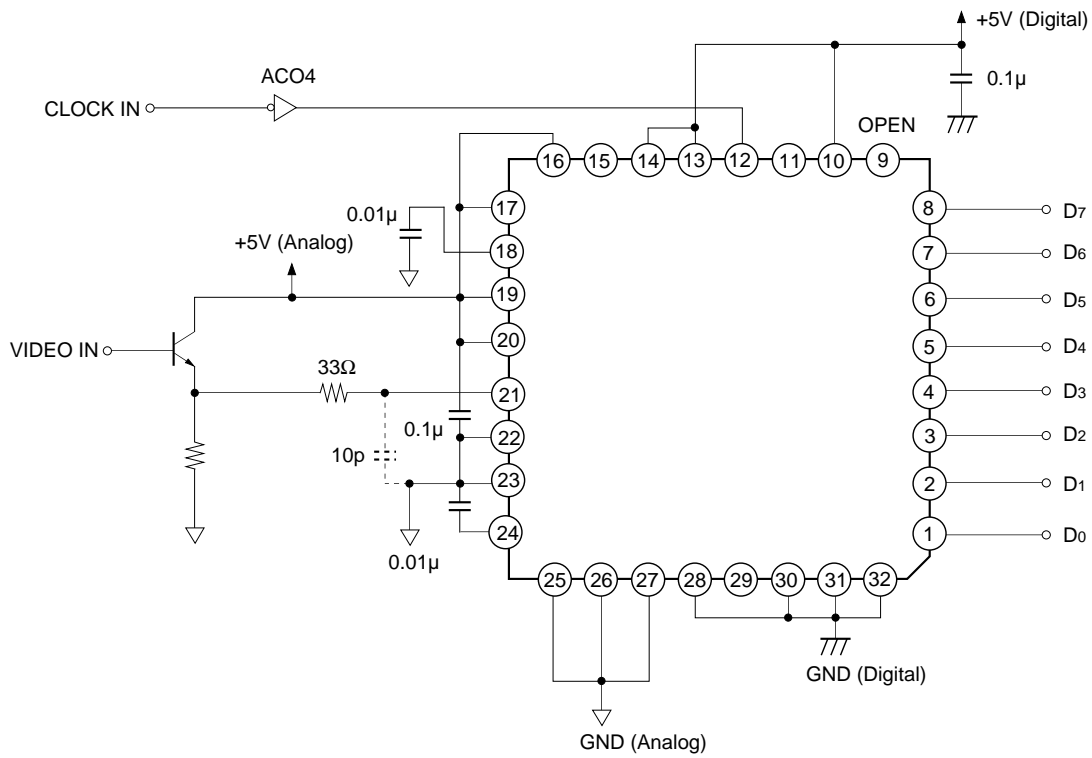

I-2. Digital clamp (self-bias used)

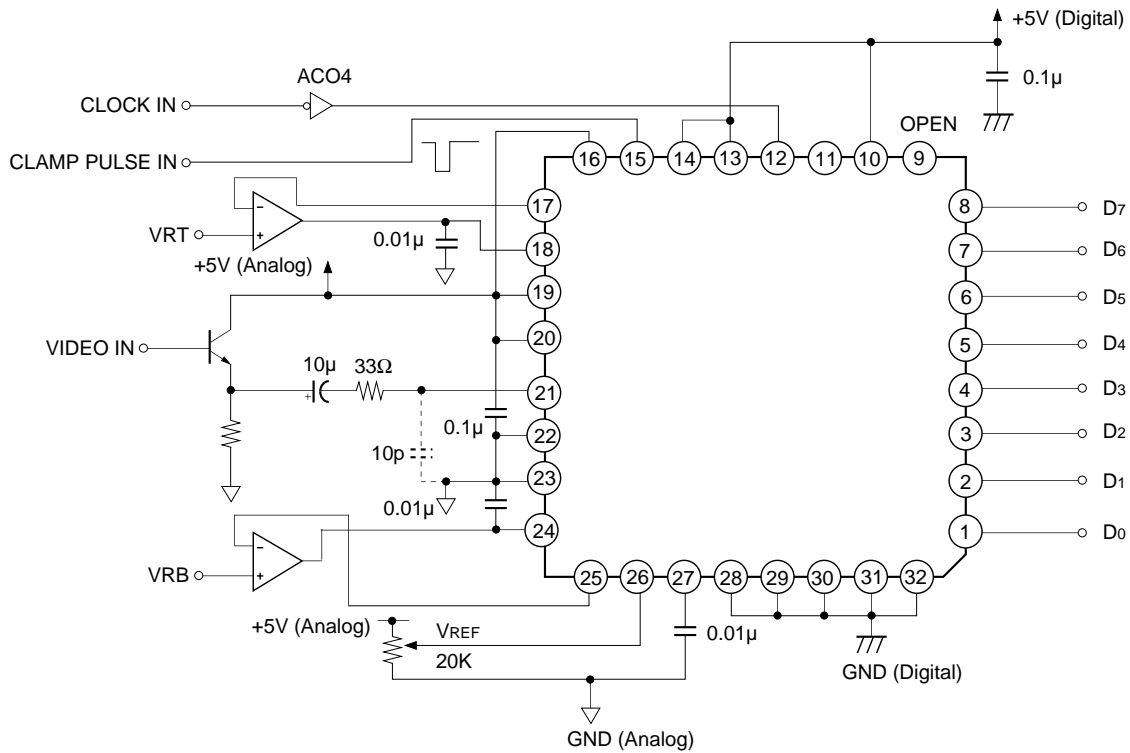

* The relationship between the changes in CCP voltage (Pin 27) and in VIN voltage is positive phase.

* $\Delta V_{in}/\Delta V_{ccp} = 3.0$ (fs = 20MSPS)

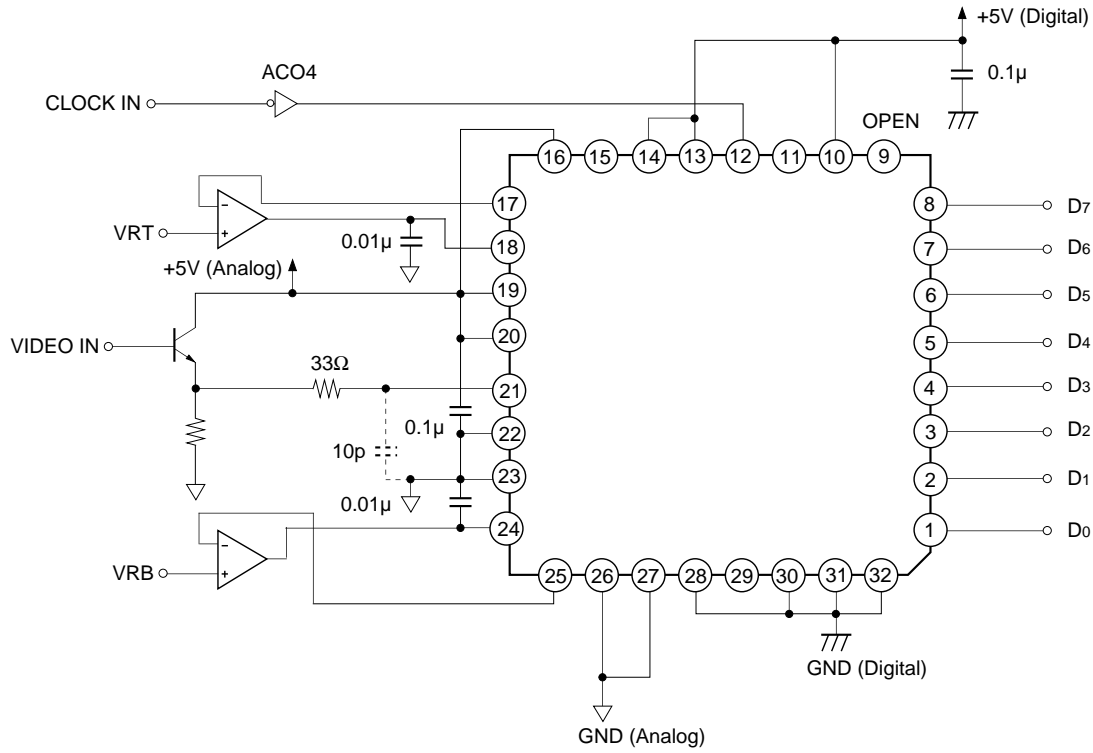

I-3. When clamp is not used (self-bias used)

8-bit 50MSPS ADC and DAC Evaluation Board

Evaluation boards are available for the high speed, low power consumption CMOS converters CXD2302Q (8-bit 50MHz A/D) and CXD1171M (8-bit 40MHz D/A).

The evaluation boards are composed of a main board, CXD2302Q sub board and CXD1171M sub board. The each board is connected with sockets.

An input interface, clock buffer and latches are mounted on the main board. The CXD2302Q and CXD1171M are mounted on each of the sub boards. Those ICs are mounted according to recommended print patterns designed to provide maximum performance to the A/D and D/A converters.

Block Diagram

Characteristics

- Resolution 8bit
- Maximum conversion rate 50MHz
- Digital input level CMOS level
- Supply voltage $\pm 5.0V$ (Single +5V power supply possible at self bias use)

Supply voltage

Item	Min.	Typ.	Max.	Unit
+5V			185	mA
-5V			20

Adjustment

1. Vref adjustment (VR1, VR2)
Adjustment of A/D converter reference voltage. VRB is adjusted through VR1 and VRT through VR2. When self bias is used, there is no need for adjustment. Reference voltage is set through self bias delivery.
2. Setting of clamp reference voltage (VR3)
Clamp reference voltage is set.
3. DAC output full scale adjustment (VR4)
Full scale voltage of D/A converter output is adjusted at the PCB shipment, the full scale voltage is adjusted to approx. 2V.
4. Sync (clamp) pulse interface (VR5)
This adjustment enables interface with the signal generator and others at the PCB shipment, adjustment is performed to obtain a threshold of approx. 2.5V to an H sync of 0 to 5V.

5. \overline{OE} , SEL, Sync, BLK, \overline{CLE} , Sync INT

The following pins are set on the main board: \overline{OE} , Sync, \overline{CLE} , Sync INT (CXD2302Q), BLK (CXD1171M) and SEL (not used). For the pins function, refer to the Pin Description. The difference between Sync pin and Sync INT pin is that a pulse above 3.5Vp-p should be input to Sync INT pin. The pulse threshold is set through VR5. For input through Sync pin, pulse is input at TTL or CMOS level. In this case cut off the junction line between Sync and Sync INT pin.

At the PCB shipment the main board pins are set as follows.

- \overline{OE} : Low (A/D output ON)
- SEL : Low
- Sync : Line junction Sync INT pin
- \overline{CLE} : Low (Clamp function ON)
- BLK : Low (Blanking OFF)

6. Clamp pulse input method

Directly input the clamp pulse as shown in Application Circuit example I-1. As SW1 is set to direct input at the PCB shipment, use it in this position.

Points on the PCB Pattern Layout

1. Set the layout not to have Digital current flow into Analog GND (For 1, see p.24 “Component side diagram”).
2. The C₂ and C₃ capacitors for the CXD2302Q sub board serve the important role of bringing out ICs full performance.
Connect over 0.1 μ F (ceramic) capacitors with good high frequency characteristics as close to the IC as possible.
3. Analog GND (AV_{SS}) and Digital GND (DV_{SS}) are on a common voltage supply source. Keeping ADC's DV_{SS} (For 2, see p.24 “Component side diagram”) as close to the voltage supply source as possible will provide better characteristics. That is, a layout where ADC is close to the voltage supply source, is recommended.
4. ADC samples analog signals at the clock falling edge. Accordingly it is important that clocks supplied to ADC do not have any jitter.
5. The PCB layout shows ADC and DAC's Analog GND independently from the voltage supply source. The layout aims at providing an independent evaluation of ADC and DAC, as much as possible. On the actual board, common use will not cause any problems.

Notes on Operation

1. Reference voltage

Shorting AV_{DD} and V_{RTS} , AV_{SS} and V_{RBS} will activate the self-bias function that generates V_{RT} = about 2.6V and V_{RB} = about 0.5V. On the PCB, either self bias or the external reference voltage can be selected depending on the junction method of the jumper line. At shipment from the factory, reference voltage is provided in self bias. Also, to provide external reference voltage, adjust the dynamic range ($V_{RT} - V_{RB}$) to above 1.8Vp-p.

2. Clock input

There are 2 modes for the PCB clock input

- 1) Provided from the external signal generator. (External clock)
- 2) Using the crystal oscillator (built-in clock driver). (Internal clock)

The 2 modes are selected using the switch on the PCB.

3. The 2 Latch ICs (74S174) are not absolutely necessary for the evaluation of ADC and DAC. That is, operation will still be normal if ADC output data is directly input to DAC input. However, as ADC output data is hardly ever D/A converted without executing Digital signal processing, it was mounted to indicate an example layout of Digital signal processing IC. Use the Latch IC output when the ADC output data is used.

4. When clamp is not used

Turning CLE to H will set OFF the clamp function. In this case, the DC element is cut off by means of C_2 on the main board and DC voltage on the ADC side of C_2 turns to about $(V_{RT} + V_{RB})/2$. To transfer DC elements of input signals, short C_2 . At that time, it is necessary to bias input signals, but keeping R_2 open, Q_3 can also be used as buffer. Use the open space for the bias circuit.

5. Clamp pulse latch

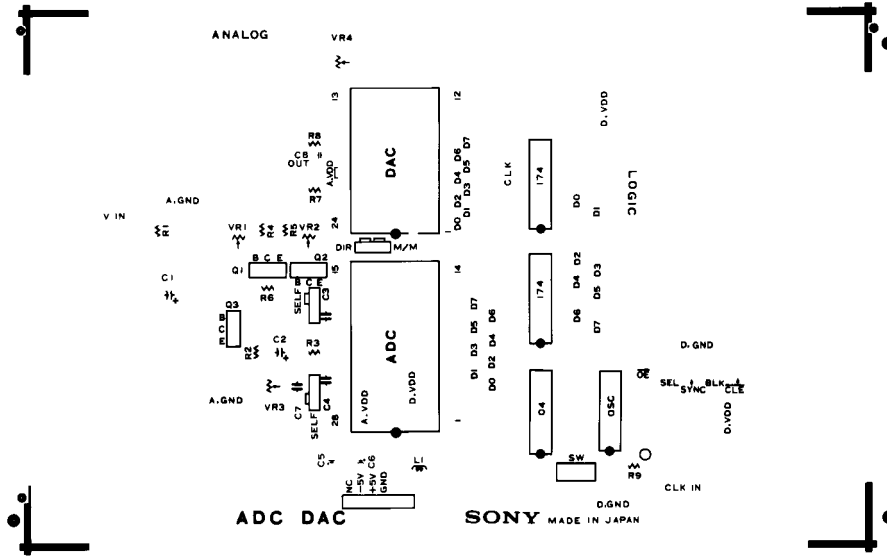

On the evaluation board, the clamp pulse is latched with ADC sampling CLK and then input to CLP pin. However, the latch is incorporated in CLP pin of the CXD2302Q, so that the external latch is not required.

6. Peripheral through hole

There is a group of through holes on the Analog input, output and Logic. There are to be used when mounting additional circuits to the PCB. Use when necessary.

The connector hole on DAC part is used to mount the test chassis mount jack.
