

VGA/SVGA/XGA 24bit Receiver

Description

CXB1454R is the 1 chip deserializer for VGA/SVGA/XGA 24bit color digital RGB, and meet to the Gigabit Video Interface specification.

Features

- 1 chip receiver for serial transmission of 24-bit color VGA/SVGA/XGA picture
- On chip cable equalizer circuit to compensate the cable loss
- On chip PLL circuit for data and clock recovery
- On chip panel mode automatically selectable circuit
- TTL compatible I/O
- Support 1 pixel/shiftclock mode with 1 chip and 2 pixel/shiftclock mode with 2 chips
- +3.3V single power supply
- Low power consumption
- 64pin plastic LQFP package with body size 14mm × 14mm

Absolute Maximum Ratings

• Supply voltage	V <sub>CC</sub>	4.0	V
• Storage temperature	T <sub>stg</sub>	-65 to +150	°C
• Allowable power dissipation	P <sub>D</sub>	1710	mW

Recommended Operating Condition

• Supply voltage	V <sub>CC</sub>	3.3 ± 0.16	V
• Operating temperature	T <sub>opr</sub>	0 to +60	°C

**CLKPOL Pin Control**

The CLKPOL pin is used to select the SFTCLK trigger edge. (See Table 8.)

The CLKPOL pin is open High TTL input.

**Table 8. SFTCLK Polarity**

CLKPOL	Receiver operation trigger
L	Rising edge
H	Falling edge

**PANEL1 and 0 Pin Control**

The PANEL1 and 0 pins are used to select the panel mode. (See Table 9.)

For the normal use, the all frequencies of SFTCLK (25MHz to 65MHz) can be covered by fixing both PANEL1 and 0 to High.

The PANEL1 and 0 pins are open High TTL inputs.

**Table 9. Panel Mode**

PANEL1	PANEL0	Supporting panel size	Shift clock	Serial rate
L	L	VGA (640 × 480)	25MHz	750Mbps
L	H	SVGA (800 × 600)	40MHz	1200Mbps
H	L	XGA (1024 × 768)	65MHz	1950Mbps
H	H	VGA to XGA	25MHz to 65MHz	750Mbps to 1950Mbps

**Test Pin Control**

The TESTEXN, TESTDT and TESTSB pins are for test only. Select normal mode. (See Table 10.)

The TESTEXN, TESTDT and TESTSB pins are open High, TTL inputs.

**Table 10. Test Mode**

TESTEXN	TESTDT	TESTSB	Operation mode
L	X	X	Test mode
H	H	H	Normal mode

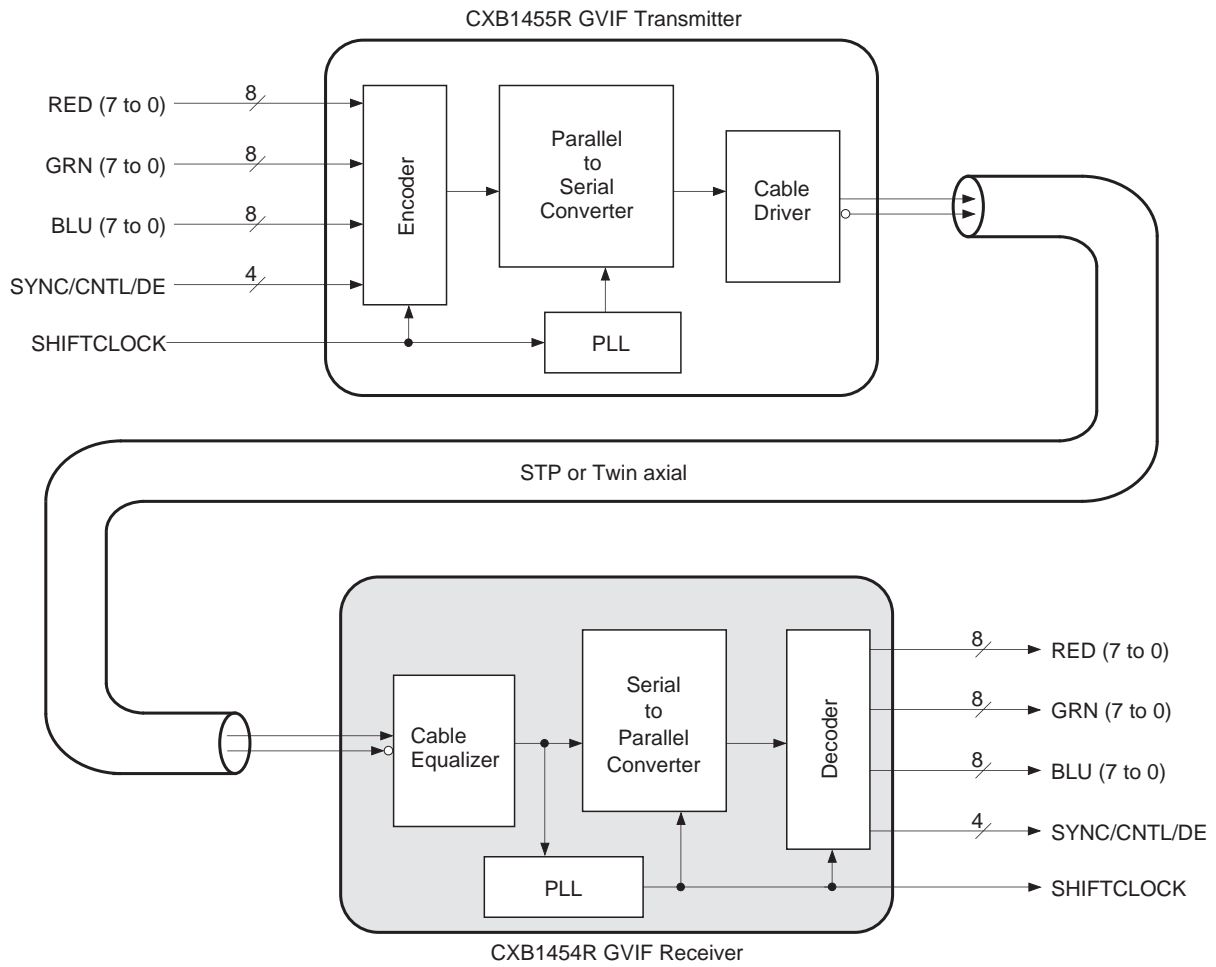

**LOS Pin Output**

The LOS pin shows the absence of proper level of SDATA signal. The LOS pin is High when the connector is disconnected or the transmitter is idle.

The LOS pin is TTL output.

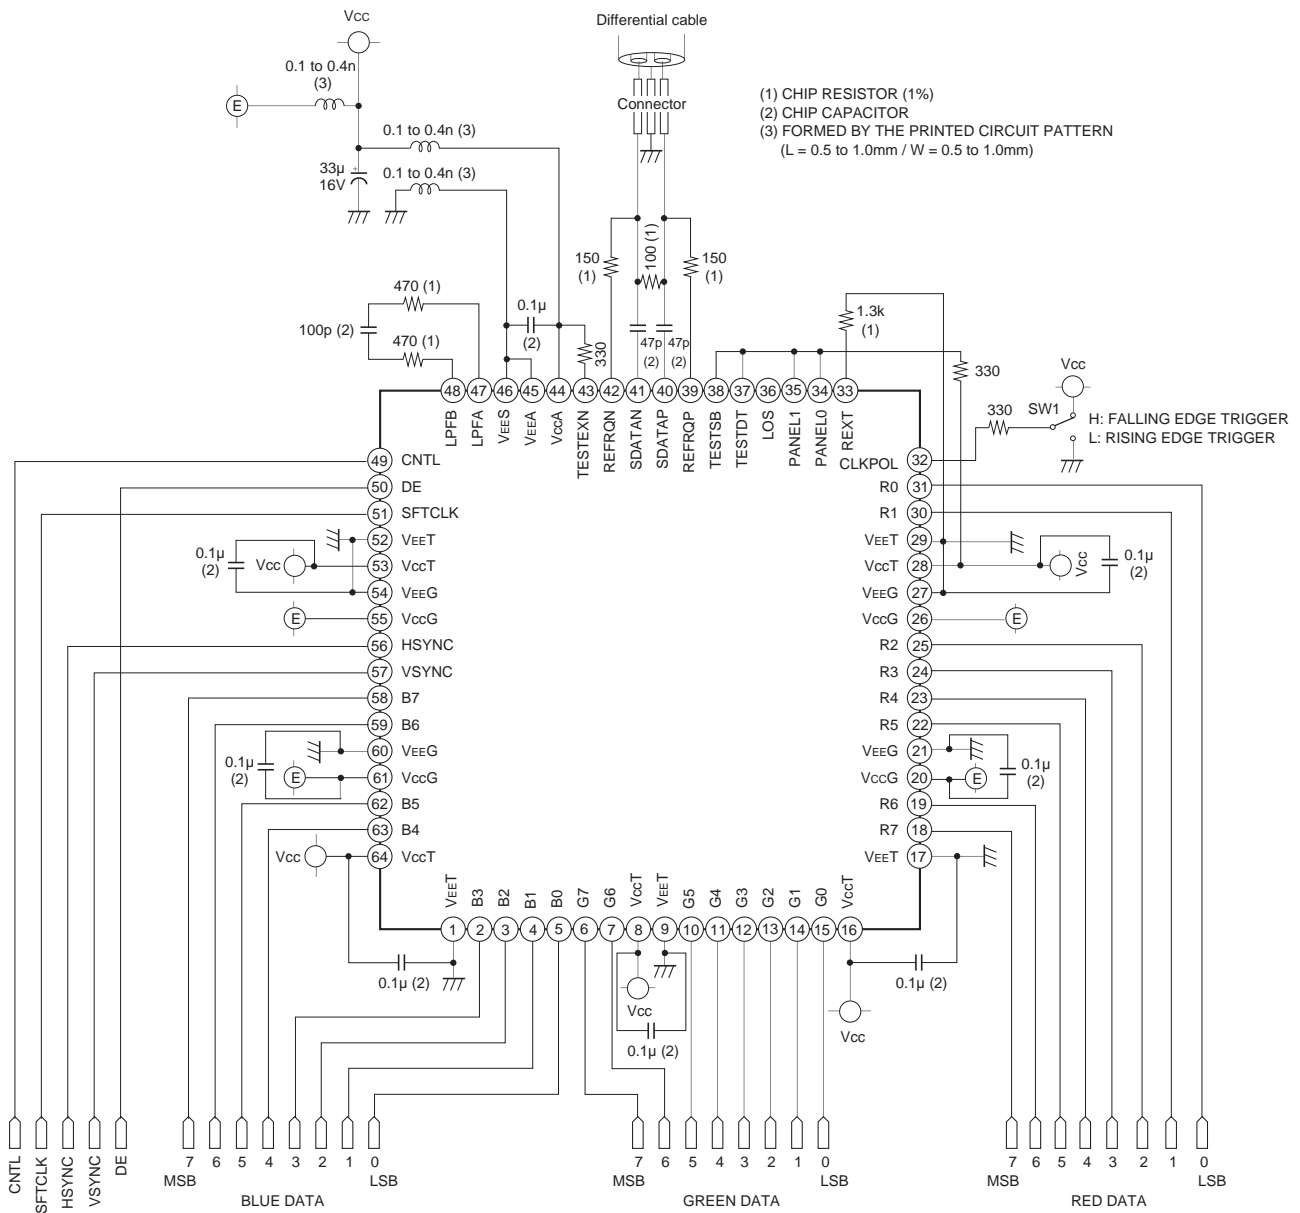

**Applications**

CXB1454R GVIF receiver is applied to the digital RGB signal transmission for  
 P/C with LCD monitor  
 Video on demand system  
 Monitoring system  
 Graphical controller  
 Projector  
 Digital TV monitor  
 Car navigation system  
 with GVIF transmitter, CXB1455R.

**Micro Strip Line**

For maximum performance, the impedance between the pins SDDATAP/N of the LSI and the footprint of the connector should be 50Ω using a micro strip line. 50Ω impedance can be reached when using 0.5mm width pattern lines on L1 using this circuit board structure. The length of the lines should be identical and through-hole should not be used. L2 is recommended as the large ground plane.

**Terminators**

Terminators (100Ω resistor) should be located as close to the LSI as possible.

**Filter Devices and Reference Resistors**

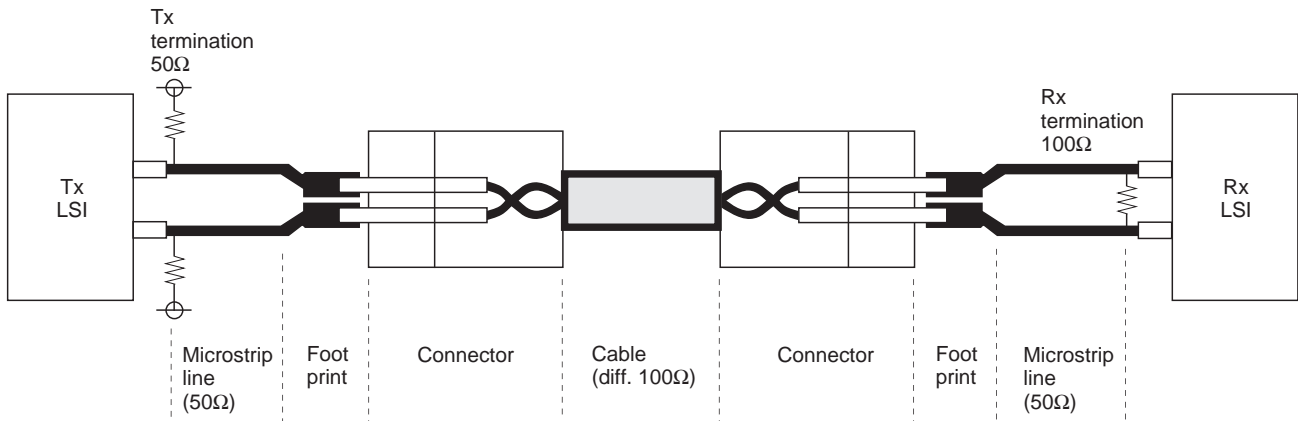

Capacitors and resistors which are connected to LPFA/B and REXT are filters and reference resistors. The region of Layer 2 (L2) is under the device and conductive patterns. The ground plane should be taken off in order to reduce parasitic capacitors.

**Bypass Capacitors**

Bypass capacitors (0.1μF SMD type) should be located as close to the pins as possible. Refer to the recommendation.

## Recommendation for Cable and Connector Characteristics

The GVIF system uses terminators at both ends (transmitter and receiver), a cable equalizer and a small amplitude differential signal. In order to solve the problems of high speed data transmission such as signal reflection, reduce the signal level and EMI. In order to achieve the best solution, note the following:

It is important to note the following issues for a good data transmission system:

- Good impedance matching  
Differential impedance should be fit to the recommended template on the next page.
- Cable loss should be small and the loss curve should be smooth.  
Maximum loss should be less than 15dB at 1GHz for the CXB1454R which has a built-in cable equalizer.  
See the next page.
- Skew of POS/NEG (differential signal) should be small  
Less than 12% of 1-bit time or 160ps@VGA, 100ps@SVGA, 60ps@XGA.
- Good EMI performance cable and connectors.

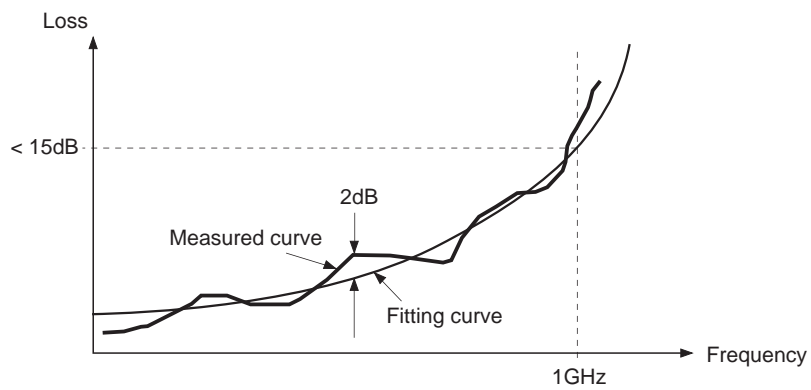

In order to satisfy these issues, the recommendations are as follows:

- Use the differential cable which provides good controlled impedance, low loss and good skew matching.  
A shielded twisted pair (STP) cable is recommended.
- Use a low reflectance connector.
- To minimize interference from other signals, high speed signal lengths should be identical.
- Use double shielded cable.
