- DIGITAL SIGNAL FEEDBACK TO INDICATE A PREDETERMINED CURRENT LEVEL

**DESCRIPTION**

The VB024 is a high voltage integrated circuit made using SGS-THOMSON VIPower technology, with vertical current flow power darlington and logic level compatible driving circuit.

The device performs the following functions: power stage for driving the primary side of the ignition coil, digital signal feedback to the control IC to indicate a predetermined current level, automatic shut-off at maximum logic current, self clamping for voltage flyback and logic level input.

## PRINCIPLE OF OPERATION

The VB024 is designed to drive the primary side of an ignition coil and provide a logic signal output to indicate a predetermined coil current level. This output signal is used to perform dwell control. This part is intended for use in Engine Control Modules. It could also be used in an ignition module or integrated into an ignition coil assembly.

The VB024 accepts an input High signal from the control IC to start charging the primary side of the ignition coil. When the primary coil current reaches 3 amps, the VB024 outputs a logic High signal to the control IC. This flag signal is used in the calculation of the dwell time.

This device also has a maximum primary coil current  $I_{\text{c(max)}}$  Shut-off feature.  $I_{\text{c(max)}}$  equals aproximately 1.5 times the nominal primary coil currnet. If the  $I_c$  reaches  $I_{\text{c(max)}}$ , the output stage will Shut-off causing the spark to occur.

The VB024 is also internally clamped to protect it from the flyback voltage of the primary inductance as the output stage is turned off.

## OVERVOLTAGE

The VB024 withstand the following transient test performed using a "Schaffner" equipment at  $T_A = 80\text{ }^\circ\text{C}$ :

### 1) LOAD DUMP

Ten pulses with 10 second intervals between each transient. The device withstand load dump while fully on, fully off and during the transition between states (see figures 3 and 4).

### 2) NEGATIVE TRANSIENTS

Ten negative transients with 10 second intervals between each transient (see figure 5).

### 3) REVERSE BATTERY

Inversion of battery voltage for a time = 60 sec (see figure 5).
