

**HIGH PERFORMANCE
DUAL OPERATIONAL AMPLIFIERS**

- LOW POWER CONSUMPTION
- SHORT CIRCUIT PROTECTION
- LOW DISTORTION, LOW NOISE
- HIGH GAIN-BANDWIDTH PRODUCT
- HIGH CHANNEL SEPARATION

DESCRIPTION

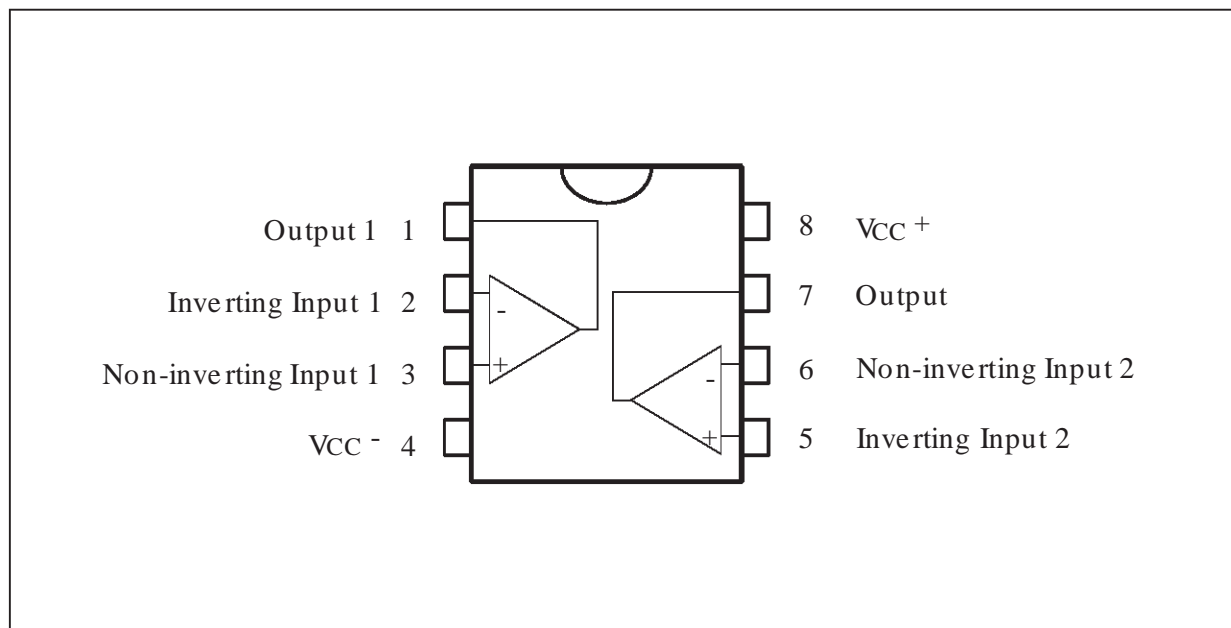

The LS204 is a high performance dual operational amplifier with frequency and phase compensation built into the chip. The internal phase compensation allows stable operation as voltage follower in spite of its high Gain-Bandwidth Product.

The circuit presents very stable electrical characteristics over the entire supply voltage range, and is particularly intended for professional and telecom applications (active filter, etc).

APPLICATION INFORMATION :

Active low-pass filter

BUTTERWORTH

The Butterworth is a "maximally flat" amplitude response filter (figure 10) Butterworth filters are used for filtering signals in data acquisition systems to prevent aliasing errors in samples-data applications and for general purpose low-pass filtering.

The cut-off frequency F_c , is the frequency at which the amplitude response is down 3dB. The attenuation rate beyond the cutoff frequency is $n6$ dB per octave of frequency where n is the order (number of poles) of the filter.

Other characteristics :

- Flattest possible amplitude response
- Excellent gain accuracy at low frequency end of passband

BESSEL

The Bessel is a type of "linear phase" filter. Because of their linear phase characteristics, these filters approximate a constant time delay over a limited frequency range. Bessel filters pass transient waveforms with a minimum of distortion. They are also used to provide time delays for low pass filtering of modulated waveforms and as a "running average" type filter.

The maximum phase shift is $\frac{-n\pi}{2}$ radians where n is the order (number of poles) of the filter. The

cut-off frequency f_c , is defined as the frequency at which the phase shift is one half of this value. For accurate delay, the cut-off frequency should be twice the maximum signal frequency.

The following table can be used to obtain the -3dB frequency of the filter.

	2 Pole	4 Pole	6 Pole	8 Pole
-3dB Frequency	0.77 f_c	0.67 f_c	0.57 f_c	0.50 f_c

Other characteristics :

- Selectivity not as great as Chebyshev or Butterworth
- Very little overshoot response to step inputs
- Fast rise time

CHEBYSCHV

Chebyshev filters have greater selectivity than either Bessel or Butterworth at the expense of ripple in the passband (figure 11).

Chebyshev filters are normally designed with peak-to-peak ripple values from 0.2dB to 2dB.

Increased ripple in the passband allows increased attenuation above the cut-off frequency.

The cut-off frequency is defined as the frequency at which the amplitude response passes through the specified maximum ripple band and enters the stop band.

Other characteristics :

- Greater selectivity
- Very non-linear phase response
- High overshoot response to step inputs

The table below shows the typical overshoot and settling time response of the low pass filters to a step input.

	Number of Poles	Peak Overshoot	Settling Time (% of final value)		
		% Overshoot	±1%	±0.1%	±0.01%
Butterworth	2	4	1.1 F_c sec.	1.7 F_c sec.	1.9 F_c sec.
	4	11	1.7 f_c	2.8 f_c	3.8 f_c
	6	14	2.4 f_c	3.9 f_c	5.0 f_c
	8	16	3.1 f_c	5.1 f_c	7.1 f_c
Bessel	2	0.4	0.8 f_c	1.4 f_c	1.7 f_c
	4	0.8	1.0 f_c	1.8 f_c	2.4 f_c
	6	0.6	1.3 f_c	2.1 f_c	2.7 f_c
	8	0.1	1.6 f_c	2.3 f_c	3.2 f_c
Chebyshev (ripple ±0.25dB)	2	11	1.1 f_c	1.6 f_c	-
	4	18	3.0 f_c	5.4 f_c	-
	6	21	5.9 f_c	10.4 f_c	-
	8	23	8.4 f_c	16.4 f_c	-
Chebyshev (ripple ±1dB)	2	21	1.6 f_c	2.7 f_c	-
	4	28	4.8 f_c	8.4 f_c	-
	6	32	8.2 f_c	16.3 f_c	-
	8	34	11.6 f_c	24.8 f_c	-

Design of 2nd order active low pass filter (Sallen and Key configuration unity gain-op-amp)

Fixed $R = R_1 = R_2$, we have (see fig. 12):

$$C1 = \frac{1}{R} \frac{\xi}{\omega_c}$$

$$C2 = \frac{1}{R} \frac{1}{\xi \omega_c}$$

The diagram of fig. 14 shows the amplitude response for different values of damping factor ξ in 2nd order filters.

Figure 12 : Filter Configuration

Three parameters are needed to characterize the frequency and phase response of a 2nd order active filter : the gain (G_v), the damping factor (ξ) or the Q-factor ($Q = (2 \xi)^{-1}$), and the cutoff frequency (f_c).

The higher order responses are obtained with a se-

Figure 13 : Filter Respons versus Damping Factor

ries of 2nd order sections. A simple RC section is introduced when an odd filter is required.

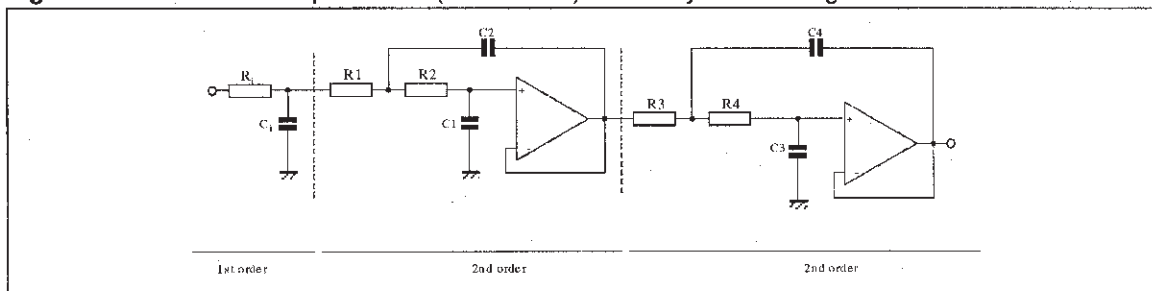

The choice of ' ξ ' (or Q-factor) determines the filter response (see table 1).

Table 1

Filter Response	ξ	Q	Cutoff Frequency f_c
Bessel	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{1}}{3}$	Frequency at which Phase Shift is -90°
Butterworth	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{1}}{2}$	Frequency at which $G_v = -3\text{dB}$
Chebyshev	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{1}}{2}$	Frequency at which the amplitude response passes through specified max. ripple band and enters the stop band.

EXAMPLE

Figure 14 : 5th Order Low-pass Filter (Butterworth) with Unity Gain Configuration

In the circuit of fig. 15, for $f_c = 3.4\text{kHz}$ and $R_i = R_1 = R_2 = R_3 = R_4 = 10\text{k}\Omega$, we obtain :

$$C_i = 1.354 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 6.33\text{nF}$$

$$C_1 = 0.421 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 1.97\text{nF}$$

$$C_2 = 1.753 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 8.20\text{nF}$$

$$C_3 = 0.309 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 1.45\text{nF}$$

$$C_4 = 3.325 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 15.14\text{nF}$$

The attenuation of the filter is 30dB at 6.8kHz and better than 60dB at 15kHz.

The same method, referring to Tab. 2 and fig. 16, is used to design high-pass filter. In this case the damping factor is found by taking the reciprocal of the numbers in Tab. 2. For $f_c = 5\text{kHz}$ and $C_i = C_1 = C_2 = C_3 = C_4 = 1\text{nF}$ we obtain :

$$R_i = \frac{1}{0.354} \cdot \frac{1}{C} \cdot \frac{1}{2\pi f_c} = 25.5\text{k}\Omega$$

$$R_1 = \frac{1}{0.421} \cdot \frac{1}{C} \cdot \frac{1}{2\pi f_c} = 75.6\text{k}\Omega$$

$$R_2 = \frac{1}{1.753} \cdot \frac{1}{C} \cdot \frac{1}{2\pi f_c} = 18.2\text{k}\Omega$$

$$R_3 = \frac{1}{0.309} \cdot \frac{1}{C} \cdot \frac{1}{2\pi f_c} = 103\text{k}\Omega$$

$$R_4 = \frac{1}{3.325} \cdot \frac{1}{C} \cdot \frac{1}{2\pi f_c} = 9.6\text{k}\Omega$$

Table 2 : Damping Factor for Low-pass Butterworth Filters
