

M48T513Y M48T513V

3.3V-5V 4 Mbit (512Kb x8) TIMEKEEPER[®] SRAM

- INTEGRATED ULTRA LOW POWER SRAM, REAL TIME CLOCK, POWER-FAIL CONTROL CIRCUIT, BATTERY, and CRYSTAL
- YEAR 2000 COMPLIANT
- BCD CODED CENTURY, YEAR, MONTH, DAY, DATE, HOURS, MINUTES, and SECONDS
- BATTERY LOW WARNING FLAG
- AUTOMATIC POWER-FAIL CHIP DESELECT and WRITE PROTECTION
- TWO WRITE PROTECT VOLTAGES: (V_{PFD} = Power-fail Deselect Voltage)
 - M48T513Y: $4.2V \leq V_{PFD} \leq 4.5V$
 - M48T513V: $2.7V \leq V_{PFD} \leq 3.0V$
- CONVENTIONAL SRAM OPERATION; UNLIMITED WRITE CYCLES
- SOFTWARE CONTROLLED CLOCK CALIBRATION for HIGH ACCURACY APPLICATIONS
- 10 YEARS of DATA RETENTION and CLOCK OPERATION in the ABSENCE of POWER
- SELF CONTAINED BATTERY and CRYSTAL in DIP PACKAGE
- MICROPROCESSOR POWER-ON RESET (Valid even during battery back-up mode)
- PROGRAMMABLE ALARM OUTPUT ACTIVE in BATTERY BACK-UP MODE
- SURFACE MOUNT CHIP SET PACKAGING INCLUDES a 44-PIN SOIC and a 32-LEAD TSOP (SNAPHAT TOP TO BE ORDERED SEPARATELY)
- SOIC PACKAGE PROVIDES DIRECT CONNECTION for a SNAPHAT TOP WHICH CONTAINS the BATTERY and CRYSTAL
- SNAPHAT[®] HOUSING (BATTERY/CRYSTAL) IS REPLACEABLE

Table 2. Absolute Maximum Ratings (1)

| Symbol | Parameter | Value | Unit |
|------------------|---|------------------------------|-------------|
| T _A | Ambient Operating Temperature | 0 to 70 | °C |
| T _{STG} | Storage Temperature (V _{CC} Off, Oscillator Off) | -40 to 85 | °C |
| V _{IO} | Input or Output Voltages | -0.3 to V _{CC} +0.3 | V |
| V _{CC} | Supply Voltage | M48T513Y | -0.3 to 7.0 |
| | | M48T513V | -0.3 to 4.6 |
| I _O | Output Current | 20 | mA |
| P _D | Power Dissipation | 1 | W |

Note: 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to the absolute maximum rating conditions for extended periods of time may affect reliability.

2. Soldering temperature not to exceed 260°C for 10 seconds (total thermal budget not to exceed 150°C for longer than 30 seconds).

CAUTION: Negative undershoots below -0.3V are not allowed on any pin while in the Battery Back-up mode.

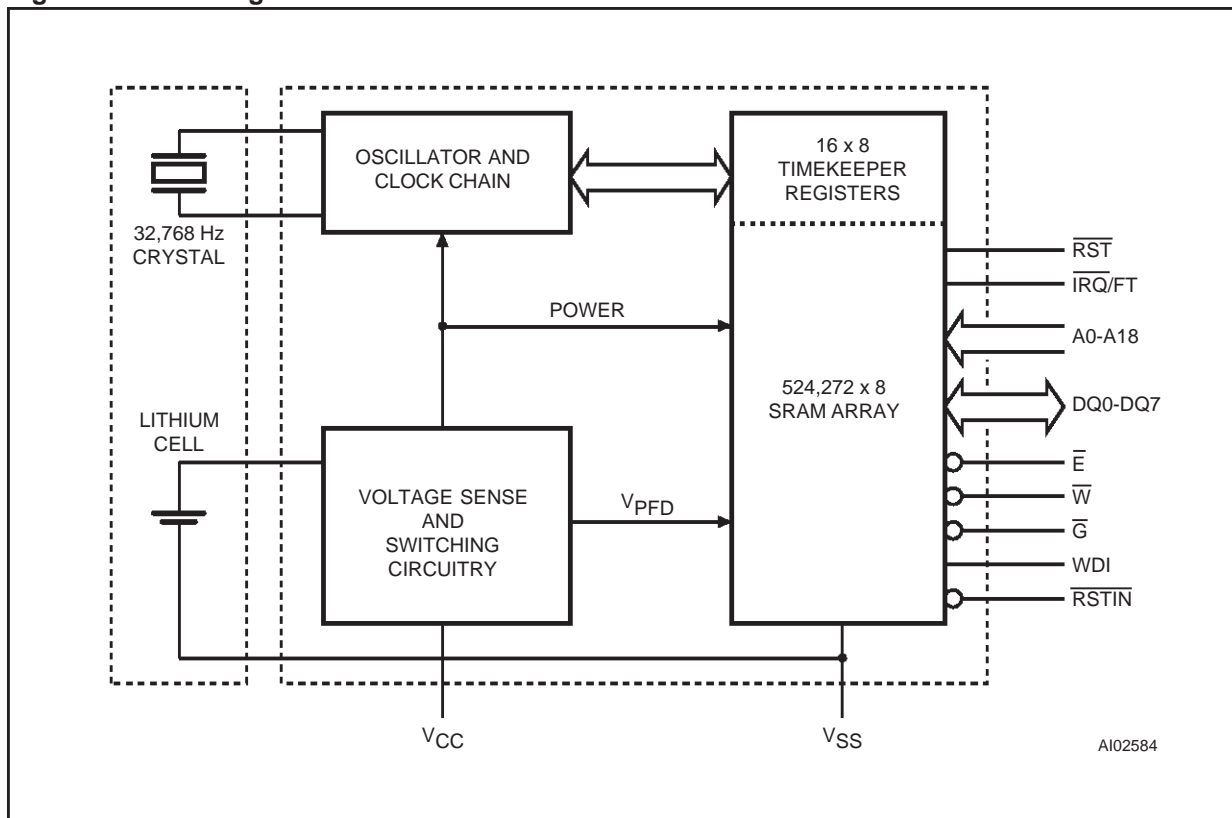

DESCRIPTION

The M48T513Y/V TIMEKEEPER RAM is a 512Kb x 8 non-volatile static RAM and real time clock, with programmable alarms and a watchdog timer. The special DIP package provides a fully integrated battery back-up memory and real time clock solution. The M48T513Y/V directly replaces industry standard 512Kb x 8 SRAM. It also provides the non-volatility of Flash without any requirement for special write timing or limitations on the number of writes that can be performed.

For surface mount environments ST provides a Chip Set solution consisting of a 44 pin 330mil SOIC TIMEKEEPER Supervisor (M48T201V/Y) and a 32 pin TSOP Type II (10 x 20mm) LPSRAM (M68Z512/W) packages.

The 44 pin 330mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT housing containing the battery.

Figure 3. Block Diagram

The unique design allows the SNAPHAT battery package to be mounted on top of the SOIC package after the completion of the surface mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion.

The SNAPHAT battery package is shipped separately in plastic anti-static tubes or in Tape & Reel form. The part number is "M4Txx-BR12SH1".

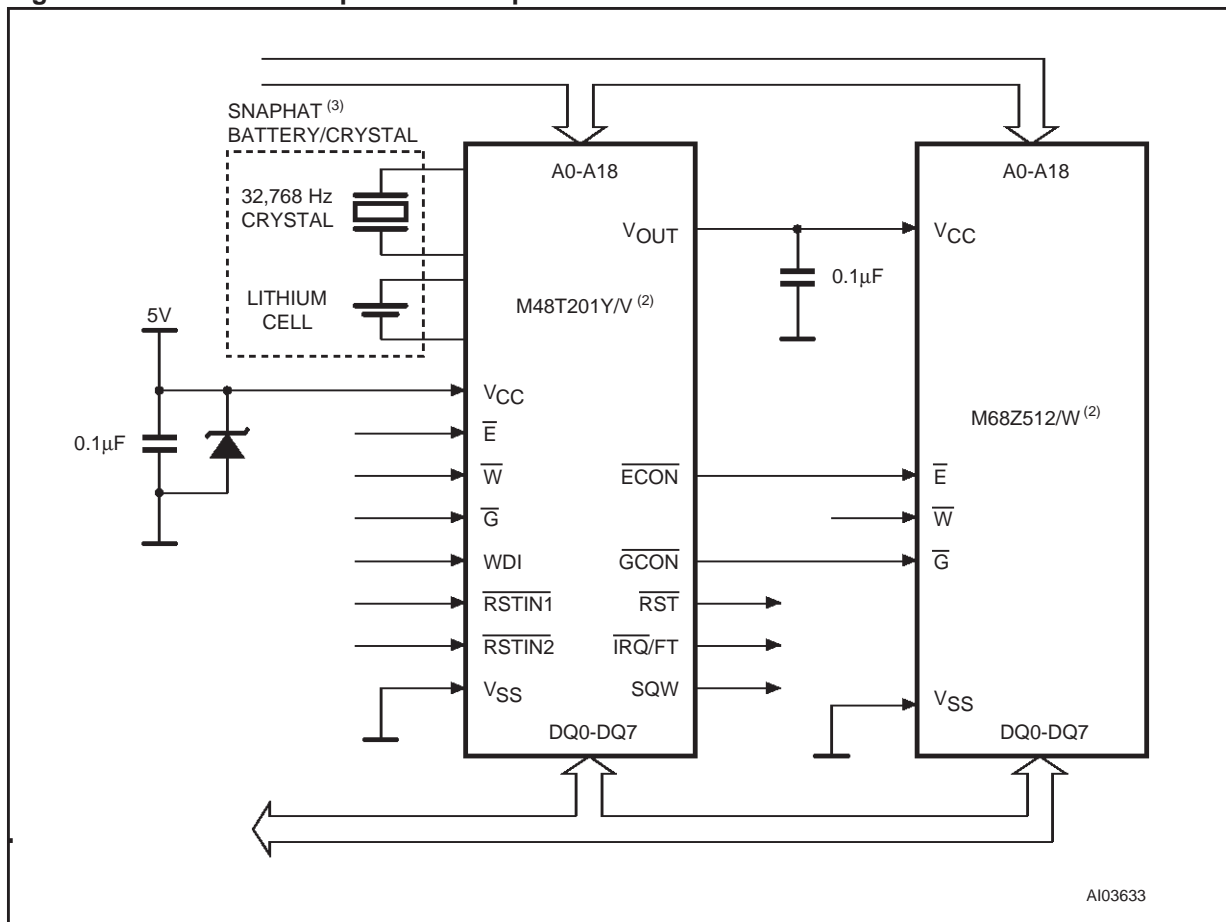

Figure 3 illustrates the static memory array and the quartz controlled clock oscillator. The clock locations contain the century, year, month, date, day, hour, minute, and second in 24 hour BCD format. Corrections for 28, 29 (leap year), 30, and 31 day months are made automatically. The nine clock bytes (7FFFh-7FFF9h and 7FFF1h) are not the actual clock counters, they are memory locations consisting of BiPORT™ read/write memory cells within the static RAM array.

The M48T513Y/V includes a clock control circuit which updates the clock bytes with current information once per second. The information can be accessed by the user in the same manner as any

other location in the static memory array. Byte 7FFF8h is the clock control register. This byte controls user access to the clock information and also stores the clock calibration setting.

Byte 7FFF7h contains the watchdog timer setting. The watchdog timer can generate either a reset or an interrupt, depending on the state of the Watchdog Steering bit (WDS). Bytes 7FFF6h-7FFF2h include bits that, when programmed, provide for clock alarm functionality. Alarms are activated when the register content matches the month, date, hours, minutes, and seconds of the clock registers. Byte 7FFF1h contains century information. Byte 7FFF0h contains additional flag information pertaining to the watchdog timer, the alarm condition and the battery status. The M48T513Y/V also has its own Power-Fail Detect circuit. This control circuitry constantly monitors the supply voltage for an out of tolerance condition. When V_{CC} is out of tolerance, the circuit write protects the TIMEKEEPER register data and external SRAM, providing data security in the midst of unpredictable system operation. As V_{CC} falls, the control circuitry automatically switches to the battery, maintaining data and clock operation until valid power is restored.

Figure 4. Hardware Hookup for SMT Chip Set (1)

Note: 1. For pin connections, see individual data sheets for M48T201Y/V and M68Z512/W at www.st.com.
 2. For 5V, M48T129Y (M48T201Y + M68Z512). For 3.3V, M48T129V (M48T201V + M68Z512W).
 3. SNAPHAT Top ordered separately.

READ MODE

The M48T513Y/V is in the Read Mode whenever \overline{W} (Write Enable) is high and \overline{E} (Chip Enable) is low. The unique address specified by the 17 Address Inputs defines which one of the 524,272 bytes of data is to be accessed. Valid data will be available at the Data I/O pins within t_{AVQV} (Address Access Time) after the last address input signal is stable, providing the \overline{E} and \overline{G} access times are also satisfied. If the \overline{E} and \overline{G} access times are not met, valid data will be available after the latter of the Chip Enable Access Times (t_{ELQV}) or Output Enable Access Time (t_{GLQV}). The state of the eight three-state Data I/O signals is controlled by \overline{E} and \overline{G} . If the outputs are activated before t_{AVQV} , the data lines will be driven to an indeterminate state until t_{AVQV} . If the Address Inputs are changed while \overline{E} and \overline{G} remain active, output data will remain valid for t_{AXQX} (Output

Data Hold Time) but will go indeterminate until the next Address Access.

WRITE MODE

The M48T513Y/V is in the Write Mode whenever \overline{W} (Write Enable) and \overline{E} (Chip Enable) are low state after the address inputs are stable. The start of a write is referenced from the latter occurring falling edge of \overline{W} or \overline{E} . A write is terminated by the earlier rising edge of \overline{W} or \overline{E} . The addresses must be held valid throughout the cycle. \overline{E} or \overline{W} must return high for a minimum of t_{EHAX} from Chip Enable or t_{WHAX} from Write Enable prior to the initiation of another read or write cycle. Data-in must be valid t_{DVWH} prior to the end of write and remain valid for t_{WHDX} afterward. \overline{G} should be kept high during write cycles to avoid bus contention; although, if the output bus has been activated by a low on \overline{E} and \overline{G} a low on \overline{W} will disable the outputs t_{WLQZ} after \overline{W} falls.

Table 3. Operating Modes (1)

| Mode | V _{CC} | \bar{E} | \bar{G} | \bar{W} | DQ0-DQ7 | Power |
|----------|---|-----------------|-----------------|-----------------|------------------|----------------------|
| Deselect | 4.5V to 5.5V or 3.0V to 3.6V | V _{IH} | X | X | High Z | Standby |
| Write | | V _{IL} | X | V _{IL} | D _{IN} | Active |
| Read | | V _{IL} | V _{IL} | V _{IH} | D _{OUT} | Active |
| Read | | V _{IL} | V _{IH} | V _{IH} | High Z | Active |
| Deselect | V _{SO} to V _{PFD} (min) (2) | X | X | X | High Z | CMOS Standby |
| Deselect | ≤ V _{SO} (2) | X | X | X | High Z | Battery Back-up Mode |

Note: 1. X = V_{IH} or V_{IL}; V_{SO} = Battery Back-up Switchover Voltage.
2. See Table 7 for details.

DATA RETENTION MODE

With valid V_{CC} applied, the M48T513Y/V operates as a conventional BYTEWIDE static RAM. Should the supply voltage decay, the RAM will automatically deselect, write protecting itself when V_{CC} falls between V_{PFD} (max), V_{PFD} (min) window. All outputs become high impedance and all inputs are treated as "don't care".

Note: A power failure during a write cycle may corrupt data at the current addressed location, but does not jeopardize the rest of the RAM's content. At voltages below V_{PFD} (min), the memory will be in a write protected state, provided the V_{CC} fall time is not less than t_F. The M48T513Y/V may respond to transient noise spikes on V_{CC} that cross into the deselect window during the time the device is sampling V_{CC}. Therefore, decoupling of the power supply lines is recommended.

When V_{CC} drops below V_{SO}, the control circuit switches power to the internal battery, preserving data and powering the clock. The internal energy source will maintain data in the M48T513Y/V for an accumulated period of at least 10 years at room temperature. As system power rises above V_{SO}, the battery is disconnected, and the power supply is switched to external V_{CC}. Deselect continues for t_{REC} after V_{CC} reaches V_{PFD} (max). For a further more detailed review of lifetime calculations, please see Application Note AN1012.

TIMEKEEPER REGISTERS

The M48T513Y/V offers 16 internal registers which contain TIMEKEEPER, Alarm, Watchdog, Interrupt, Flag, and Control data. These registers are memory locations which contain external (user accessible) and internal copies of the data (usually

Table 4. AC Measurement Conditions

| | |
|---------------------------------------|---------|
| Input Rise and Fall Times | ≤ 5ns |
| Input Pulse Voltages | 0 to 3V |
| Input and Output Timing Ref. Voltages | 1.5V |

Note that Output Hi-Z is defined as the point where data is no longer driven.

Note: Excluding open drain output pins.

referred to as BiPORT™ TIMEKEEPER cells). The external copies are independent of internal functions except that they are updated periodically by the simultaneous transfer of the incremented internal copy. TIMEKEEPER and Alarm Registers store data in BCD.

CLOCK OPERATIONS

Reading the Clock

Updates to the TIMEKEEPER registers should be halted before clock data is read to prevent reading data in transition. Because the BiPORT TIMEKEEPER cells in the RAM array are only data registers, and not the actual clock counters, updating the registers can be halted without disturbing the clock itself.

Updating is halted when a '1' is written to the READ bit, D6 in the Control Register (7FFF8h). As long as a '1' remains in that position, updating is halted. After a halt is issued, the registers reflect the count; that is, the day, date, and time that were current at the moment the halt command was issued. All of the TIMEKEEPER registers are updated simultaneously. A halt will not interrupt an update in progress. Updating occurs 1 second after the READ bit is reset to a '0'.

Setting the Clock

Bit D7 of the Control Register (7FFF8h) is the WRITE bit. Setting the WRITE bit to a '1', like the READ bit, halts updates to the TIMEKEEPER registers. The user can then load them with the correct day, date, and time data in 24 hour BCD format (see Table 11).

Resetting the WRITE bit to a '0' then transfers the values of all time registers (7FFFh-7FFF9h, 7FFF1h) to the actual TIMEKEEPER counters and allows normal operation to resume. After the WRITE bit is reset, the next clock update will occur approximately one second later.

Note: Upon power-up following a power failure, both the WRITE bit and the READ bit will be reset to '0'.

Stopping and Starting the Oscillator

The oscillator may be stopped at any time. If the device is going to spend a significant amount of time on the shelf, the oscillator can be turned off to minimize current drain on the battery. The STOP bit is located at Bit D7 within 7FFF9h. Setting it to a '1' stops the oscillator. When reset to a '0', the M48T513Y/V oscillator starts within one second.

Note: It is not necessary to set the WRITE bit when setting or resetting the FREQUENCY TEST bit (FT) or the STOP bit (ST).

SETTING ALARM CLOCK

Registers 7FFF6h-7FFF2h contain the alarm settings. The alarm can be configured to go off at a prescribed time on a specific month, date, hour, minute, or second or repeat every month, day, hour, minute, or second. It can also be programmed to go off while the M48T513Y/V is in the battery back-up to serve as a system wake-up call. Bits RPT5-RPT1 put the alarm in the repeat mode of operation. Table 12 shows the possible configurations. Codes not listed in the table default to the once per second mode to quickly alert the user of an incorrect alarm setting.

Note: User must transition address (or toggle Chip Enable) to see Flag Bit change.

When the clock information matches the alarm clock settings based on the match criteria defined by RPT5-RPT1, the AF (Alarm Flag) is set. If AFE (Alarm Flag Enable) is also set, the alarm condition activates the $\overline{\text{IRQ/FT}}$ pin. To disable alarm, write '0' to the Alarm Date register and RPT1-4. The $\overline{\text{IRQ/FT}}$ output is cleared by a read to the Flags register as shown in Figure 12. A subsequent read of the Flags register will reset the Alarm Flag (D6; Register 7FFF0h).

The $\overline{\text{IRQ/FT}}$ pin can also be activated in the battery back-up mode. The $\overline{\text{IRQ/FT}}$ will go low if an alarm occurs and both ABE (Alarm in Battery Back-up Mode Enable) and AFE are set. The ABE and AFE bits are reset during power-up, therefore an alarm generated during power-up will only set AF. The user can read the Flag Register at system boot-up to determine if an alarm was generated while the M48T513Y/V was in the deselect mode during power-up. Figure 13 illustrates the back-up mode alarm timing.

WATCHDOG TIMER

The watchdog timer can be used to detect an out-of-control microprocessor. The user programs the watchdog timer by setting the desired amount of time-out into the Watchdog Register, address 7FFF7h. Bits BMB4-BMB0 store a binary multiplier and the two lower order bits RB1-RB0 select the resolution, where 00 = 1/16 second, 01 = 1/4 second, 10 = 1 second, and 11 = 4 seconds. The amount of time-out is then determined to be the multiplication of the five bit multiplier value with the resolution. (For example: writing 00001110 in the Watchdog Register = 3*1 or 3 seconds).

Note: Accuracy of timer is within \pm the selected resolution.

| t _{WHQX} ^(1, 2) | Write Enable High to Output Transition | 5 | | 5 | | ns |

Note: 1. C_L = 5pF.
2. If \overline{E} goes low simultaneously with \overline{W} going low, the outputs remain in the high impedance state.

If the processor does not reset the timer within the specified period, the M48T513Y/V sets the WDF (Watchdog Flag) and generates a watchdog interrupt or a microprocessor reset. WDF is reset by reading the Flags Register (Address 7FFF0h). The most significant bit of the Watchdog Register is the Watchdog Steering Bit (WDS). When set to a '0', the watchdog will activate the \overline{IRQ}/FT pin when timed-out. When WDS is set to a '1', the watchdog will output a negative pulse on the \overline{RST} pin for 40 to 200 ms. The Watchdog register and the FT bit will reset to a '0' at the end of a Watchdog time-out when the WDS bit is set to a '1'. The watchdog timer can be reset by two methods: 1) a transition (high-to-low or low-to-high) can be applied to the Watchdog Input pin (WDI) or 2) the microprocessor can perform a write of the Watchdog Register. The time-out period then starts over. The WDI pin should be tied to V_{SS} if not used. The watchdog will be reset on each transition (edge) seen by the WDI pin. In the order to perform a software reset of the watchdog timer, the original time-out period can be written into the Watchdog Register, effectively restarting the count-down cycle.

Should the watchdog timer time-out, and the WDS bit is programmed to output an interrupt, a value of 00h needs to be written to the Watchdog Register in order to clear the \overline{IRQ}/FT pin. This will also disable the watchdog function until it is again programmed correctly. A read of the Flags Register will reset the Watchdog Flag (Bit D7; Register 7FFF0h).

The watchdog function is automatically disabled upon power-down and the Watchdog Register is cleared. If the watchdog function is set to output to the \overline{IRQ}/FT pin and the frequency test function is activated, the watchdog or alarm function prevails and the frequency test function is denied.

POWER-ON RESET

The M48T513Y/V continuously monitors V_{CC}. When V_{CC} falls to the power fail detect trip point, the \overline{RST} pulls low (open drain) and remains low on power-up for 40 to 200ms after V_{CC} passes V_{PFD}. The \overline{RST} pin is an open drain output and an appropriate pull-up resistor to V_{CC} should be chosen to control the rise time.

Figure 8. Chip Enable or Output Enable Controlled, Read Mode AC Waveforms

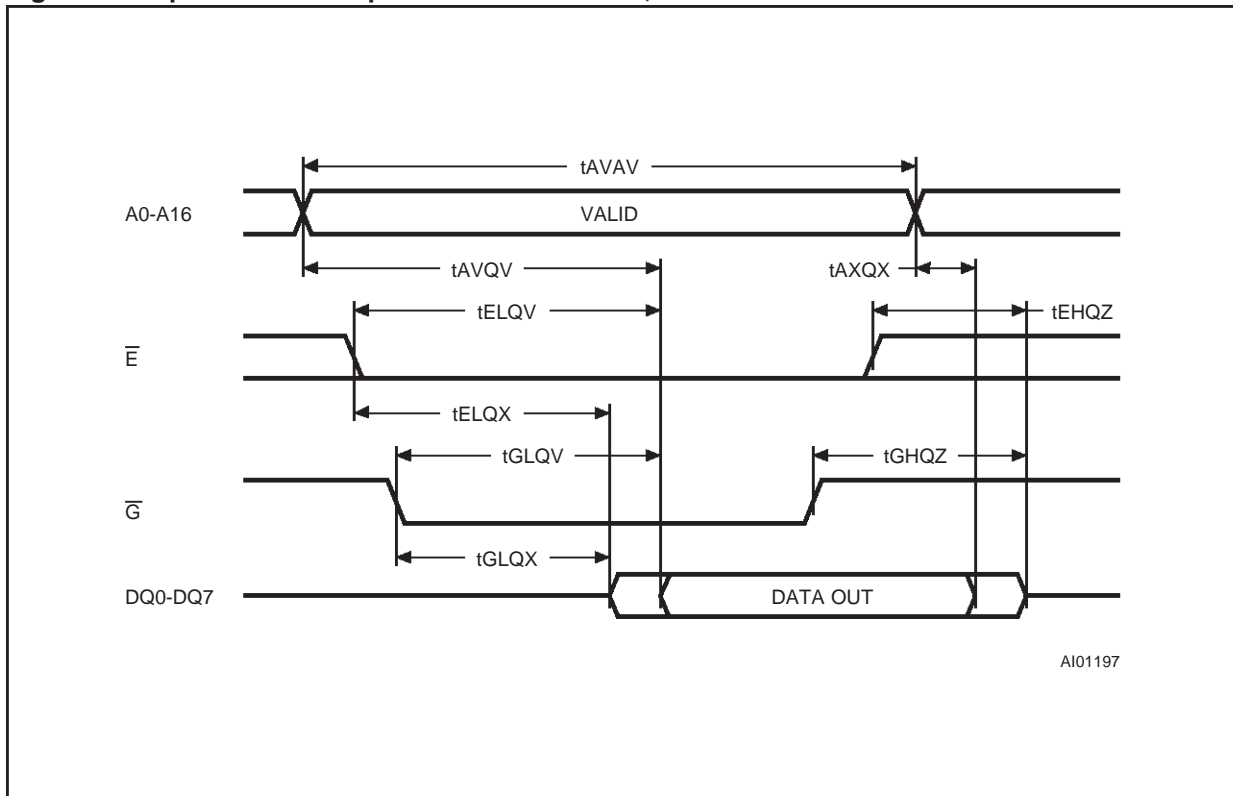

Figure 9. Write Enable Controlled, Write AC Waveforms

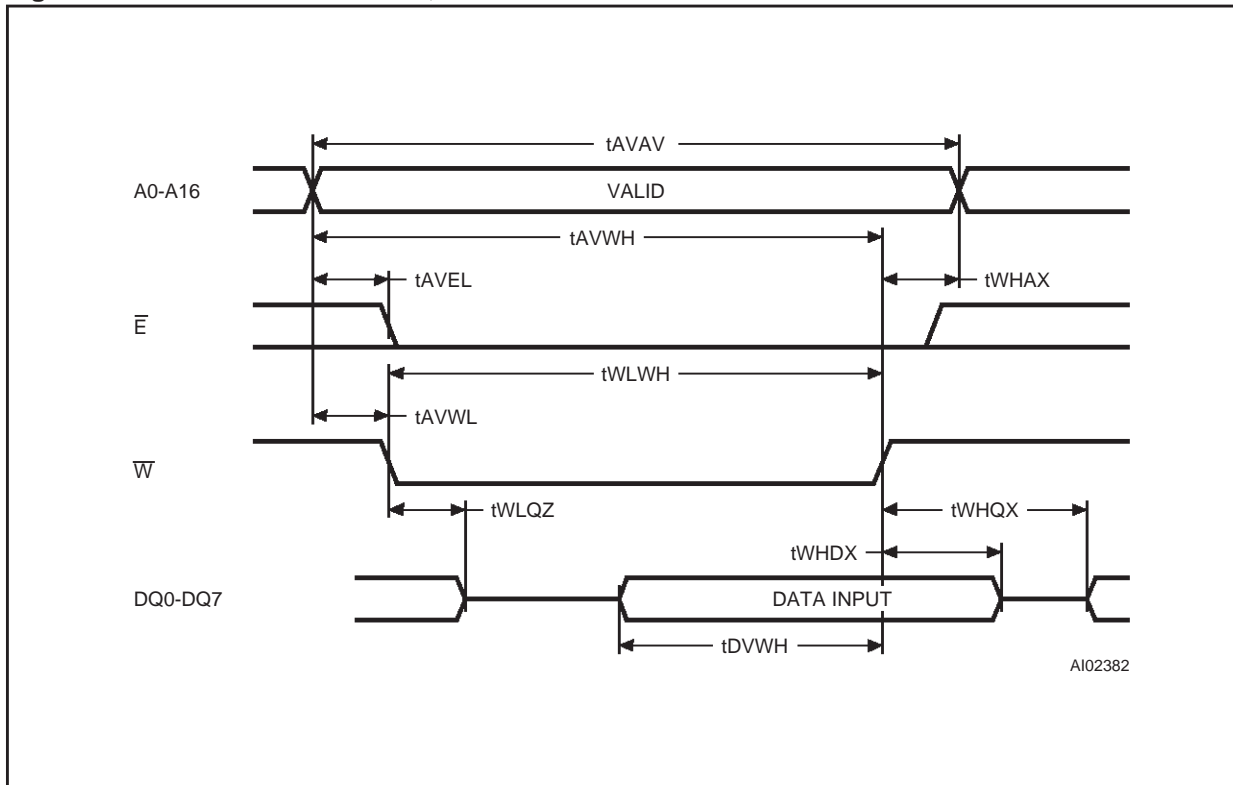

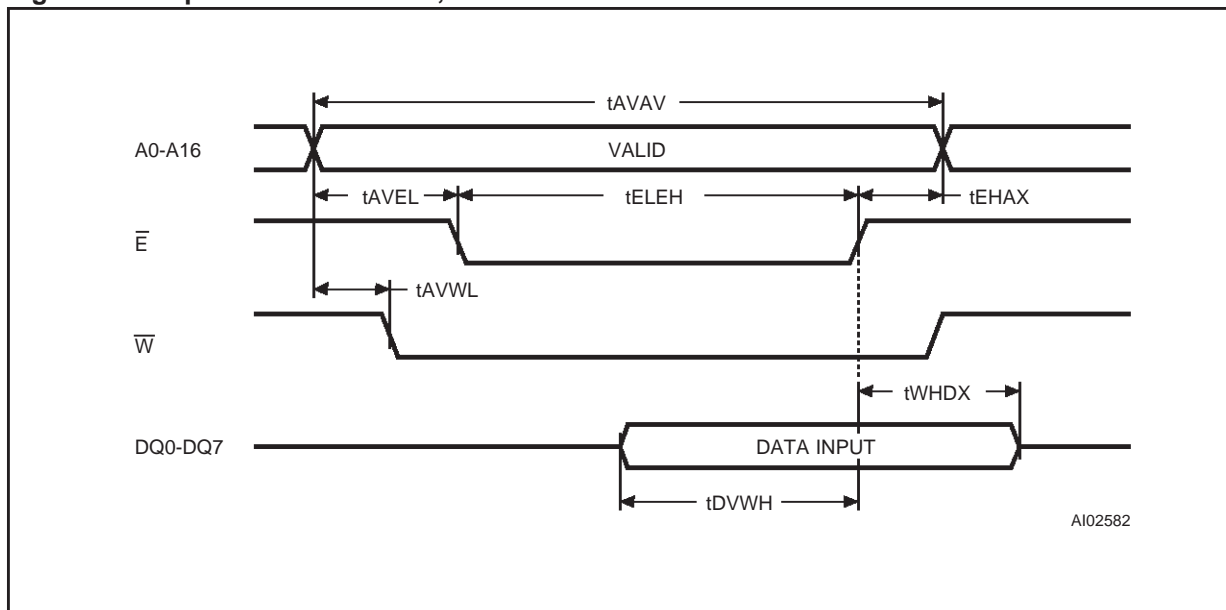

Figure 10. Chip Enable Controlled, Write AC Waveforms

RESET INPUT (\overline{RSTIN})

The M48T513Y/V provides an independent input which can generate an output reset. The duration and function of this reset is identical to a reset generated by a power cycle. Table 13 and Figure 14 illustrate the AC reset characteristics of this function. Pulses shorter than t_R will not generate a reset condition. \overline{RSTIN} is internally pulled up to V_{CC} through a 100K Ω resistor.

CALIBRATING THE CLOCK

The M48T513Y/V is driven by a quartz controlled oscillator with a nominal frequency of 32,768Hz. The devices are factory calibrated at 25°C and tested for accuracy. Clock accuracy will not exceed 35 ppm (parts per million) oscillator frequency error at 25°C, which equates to about * 1.53 minutes per month. When the Calibration circuit is properly employed, accuracy improves to better than 4 ppm at 25°C. The oscillation rate of crystals changes with temperature. The M48T513Y/V design employs periodic counter correction. The calibration circuit adds or subtracts counts from the oscillator divider circuit at the divide by 256 stage, as shown in Figure 11.

The number of times pulses which are blanked (subtracted, negative calibration) or split (added, positive calibration) depends upon the value loaded into the five Calibration bits found in the Control Register. Adding counts speeds the clock up, subtracting counts slows the clock down. The Calibration bits occupy the five lower order bits (D4-D0) in

the Control Register 7FFF8h. These bits can be set to represent any value between 0 and 31 in binary form. Bit D5 is a Sign bit; '1' indicates positive calibration, '0' indicates negative calibration. Calibration occurs within a 64 minute cycle. The first 62 minutes in the cycle may, once per minute, have one second either shortened by 128 or lengthened by 256 oscillator cycles.

If a binary '1' is loaded into the register, only the first 2 minutes in the 64 minute cycle will be modified; if a binary 6 is loaded, the first 12 will be affected, and so on. Therefore, each calibration step has the effect of adding 512 or subtracting 256 oscillator cycles for every 125, 829, 120 actual oscillator cycles, that is +4.068 or -2.034 ppm of adjustment per calibration step in the calibration register. Assuming that the oscillator is running at exactly 32,768Hz, each of the 31 increments in the Calibration byte would represent +10.7 or -5.35 seconds per month which corresponds to a total range of +5.5 or -2.75 minutes per month. Figure 11 illustrates a TIMEKEEPER calibration waveform.

Two methods are available for ascertaining how much calibration a given M48T513Y/V may require. The first involves setting the clock, letting it run for a month and comparing it to a known accurate reference and recording deviation over a fixed period of time.

Calibration values, including the number of seconds lost or gained in a given period, can be found in Application Note: TIMEKEEPER CALIBRATION.

Table 11. TIMEKEEPER Register Map

| Address | Data | | | | | | | | Function/Range BCD Format | |
|---------|-----------|---------------|-------------|-------------|------------------------|-------------|-----|---------|------------------------------|-------|
| | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | | |

| 7FFF0h | WDF | AF | 0 | BL | Y | Y | Y | Y | Flag | |

Keys: S = SIGN Bit
 FT = FREQUENCY TEST Bit
 R = READ Bit
 W = WRITE Bit
 ST = STOP Bit
 0 = Must be set to '0'
 Y = '1' or '0'
 BL = Battery Low

AF = Alarm Flag
 WDS = Watchdog Steering Bit
 BMB0-BMB4 = Watchdog Multiplier Bits
 RB0-RB1 = Watchdog Resolution Bits
 AFE = Alarm Flag Enable
 ABE = Alarm in Battery Back-up Mode Enable
 RPT1-RPT5 = Alarm Repeat Mode Bits
 WDF = Watchdog Flag

Table 12. Alarm Repeat Mode

| RPT4 | RPT3 | RPT2 | RPT1 | Alarm Activated |
|------|------|------|------|-----------------|
| 1 | 1 | 1 | 1 | Once per Second |
| 1 | 1 | 1 | 0 | Once per Minute |
| 1 | 1 | 0 | 0 | Once per Hour |
| 1 | 0 | 0 | 0 | Once per Day |
| 1 | 0 | 0 | 0 | Once per Month |

This allows the designer to give the end user the ability to calibrate the clock as the environment requires, even if the final product is packaged in a non-user serviceable enclosure. The designer could provide a simple utility that accesses the Calibration byte.

The second approach is better suited to a manufacturing environment, and involves the use of the $\overline{\text{IRQ}}/\text{FT}$ pin. The pin will toggle at 512Hz, when the Stop bit (ST, D7 of 7FFF9h) is '0', the Frequency Test bit (FT, D6 of 7FFFCh) is '1', the Alarm Flag Enable bit (AFE, D7 of 7FFF6h) is '0', and the Watchdog Steering bit (WDS, D7 of 7FFF7h) is '1' or the Watchdog Register (7FFF7h = 0) is reset.

Note: A 4 second settling time must be allowed before reading the 512Hz output.

Any deviation from 512Hz indicates the degree and direction of oscillator frequency shift at the test temperature. For example, a reading of 512.010124Hz would indicate a +20 ppm oscillator frequency error, requiring a -10 (WR001010) to be loaded into the Calibration Byte for correction. Note that setting or changing the Calibration Byte does not affect the Frequency test output frequency.

The $\overline{\text{IRQ}}/\text{FT}$ pin is an open drain output which requires a pull-up resistor for proper operation. A 500-10k Ω resistor is recommended in order to control the rise time. The FT bit is cleared on power-up.

BATTERY LOW WARNING

The M48T513Y/V automatically performs battery voltage monitoring upon power-up and at factory-programmed time intervals of approximately 24 hours. The Battery Low (BL) bit, Bit D4 of Flags Register 7FFF0h, will be asserted if the battery voltage is found to be less than approximately 2.5V.

If a battery low is generated during a power-up sequence, this indicates that the battery is below approximately 2.5 volts and may not be able to maintain data integrity in the SRAM. Data should be considered suspect and verified as correct.

If a battery low indication is generated during the 24-hour interval check, this indicates that the battery is near end of life. However, data is not compromised due to the fact that a nominal V_{CC} is supplied.

The M48T513Y/V only monitors the battery when a nominal V_{CC} is applied to the device. Thus applications which require extensive durations in the battery back-up mode should be powered-up periodically (at least once every few months) in order for this technique to be beneficial. Additionally, if a battery low is indicated, data integrity should be verified upon power-up via a checksum or other technique.

POWER-ON DEFAULTS

Upon application of power to the device, the following register bits are set to a '0' state: WDS, BMB0-BMB4, RB0, RB1, AFE, ABE, W, R and FT.

Figure 14. $\overline{\text{RSTIN}}$ Timing Waveform

Table 13. Reset AC Characteristics
 ($T_A = 0$ to 70 °C, $V_{CC} = 3.0\text{V}$ to 3.6V or $V_{CC} = 4.5\text{V}$ to 5.5V)

| Symbol | Parameter | Min | Max | Unit |
|-------------------------|--|-----|-----|------|
| t_R | $\overline{\text{RSTIN}}$ Low to $\overline{\text{RST}}$ Low | 20 | 100 | ms |
| $t_{\text{RHRZ}}^{(1)}$ | $\overline{\text{RSTIN}}$ High to $\overline{\text{RST}}$ Hi-Z | 40 | 200 | ms |

Note: 1. $C_L = 5\text{pF}$ (see Figure 5)

Figure 15. Supply Voltage Protection

POWER SUPPLY DECOUPLING and UNDERSHOOT PROTECTION

I_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy, which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of $0.1\mu\text{F}$ (see Figure 15) is recommended in order to provide the needed filtering. In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, ST recommends connecting a schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC} , anode to V_{SS}). (Schottky diode 1N5817 is recommended for through hole and MBRS120T3 is recommended for surface mount).

Table 14. Ordering Information Scheme

| | | | | |
|---|--|-----|----|---|
| Example: | M48T513Y | -70 | PM | 1 |
| Device Type | M48T | | | |
| Supply Voltage and Write Protect Voltage | 513Y = $V_{CC} = 4.5V$ to $5.5V$; $V_{PFD} = 4.2V$ to $4.5V$ 513V = $V_{CC} = 3.0V$ to $3.6V$; $V_{PFD} = 2.7V$ to $3.0V$ | | | |
| Speed | -70 = 70ns -85 = 85 ns | | | |
| Package | PM = PMDIP32 CS ⁽¹⁾ = Surface Mount Chip Set solution M48T201Y/V (SOH44) + M68Z512/W (TSOP32) | | | |
| Temperature Range | 1 = 0 to 70 °C | | | |

Note: 1. The SOIC package (SOH44) requires the battery package (SNAPHAT) which is ordered separately under the part number "M4Txx-BR12SH1" in plastic tube or "M4Txx-BR12SH1TR" in Tape & Reel form.

Caution: Do not place the SNAPHAT battery package "M4Txx-BR12SH1" in conductive foam since this will drain the lithium button-cell battery.

For a list of available options (Speed, Package, etc...) or for further information on any aspect of this device, please contact the ST Sales Office nearest to you.
