HARDWARE DESCRIPTION

The ST19SF64, a member of the ST19 device family, is a serial access microcontroller especially designed for very large volume and cost competitive secure portable objects.

The ST19SF64 is based on a STMicroelectronics 8 bit CPU core including on-chip memories: 960 Bytes of RAM, 32 KBytes of USER ROM and 64 K Bytes of EEPROM.

RAM, ROM and EEPROM memories can be configured into partitions. Access rules from any memory partition to another partition are setup by the user defined Memory Access Control Logic.

It is manufactured using the highly reliable ST sub-micron technology.

As all other ST19 family members, it is fully compatible with the ISO standards for Smartcard applications.

SOFTWARE DEVELOPMENT

Software development and firmware (ROM code/options) generation are completed by the ST16-19 HDS development system.
