### DESCRIPTION

The 74AC16373 CMOS 16 BIT D-TYPE LATCH with 3 STATE OUTPUTS NON INVERTING fabricated with sub-micron silicon gate and double-layer metal wiring C<sup>2</sup>MOS technology. These 16 bit D-TYPE latches are byte controlled by two latch enable inputs (nLE) and two output enable inputs(nOE).

While the nLE input is held at a high level, the nQ outputs will follow the data (D) inputs.

When the nLE is taken LOW, the nQ outputs will be latched at the logic level of D data inputs.

When the (nOE) input is low, the nQ outputs will be in a normal logic state (high or low logic level); when nOE is at high level ,the outputs will be in a high impedance state.

All inputs and outputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.
