## Dual 10-Bit Nonvolatile DAC

## FEATURES

- Two 10-Bit Nonvolatile DACs
- INL $\pm 1$ LSB
- DNL $\pm 1 \mathrm{LSB}$
- Programmable Configuration
- Programmable Power On Reset Options
- Recall Full Scale Value
- Recall Zero Scale Value
- Recall Mid-Scale Value
- Recall NV Register Value

## APPLICATIONS

- ATE Set and Forget Calibration
- RFPA Biasing
- Laser Biasing

## SIMPLIFIED APPLICATION DRAWING

## SMP9210, SMP9211, SMP9212

## INTRODUCTION

The SMP9210, -11, -12 trio are serial input, voltage output, dual 10-Bit digital to analog converters. They can operate from a single 2.7 V to 5.5 V supply. Internal precision buffers swing rail-to-rail with an input reference range from ground to the positive supply.
They integrate two 10-Bit DACs and their associated circuits: an enhanced unity gain operational amplifier
output, a 10-Bit volatile data latch, a 10-bit nonvolatile data register and an industry standard 2-wire serial interface.

Programming of configuration, control and calibration values by the user can be simplified with the interface adapter and Windows GUI software obtainable from Summit Microelectronics.

## RECOMMENDED OPERATING CONDITIONS

| Temperature | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. |
| :--- | :--- |
| Voltage | 2.7 V to 5.5 V |

## FUNCTIONAL BLOCK DIAGRAMS

Note: Pinouts for these three drawings reflect the 14 pin SOIC package.

## PIN CONFIGURATIONS

2048 14-PCon

2048 16-PCon

## PIN DESCRIPTIONS

$V_{D D}$
Power supply input.

## GND

Power supply return.

## Vout1, Vout2

The voltage output of the DACs. It is buffered by a unitygain follower that can slew up to $1 \mathrm{~V} / \mu \mathrm{s}$.

## $\mathbf{V}_{\text {REFL1 }}$, $\mathbf{V}_{\text {RefL }}$

The lower of the voltage reference inputs. $V_{\text {REF }} L$ must be equal to or greater than ground and less than $\mathrm{V}_{\text {REF }} \mathrm{H}$.

## $\mathbf{V}_{\text {REF }} \mathbf{H} 1, \mathrm{~V}_{\text {Ref }} \mathbf{H} 2$

The higher of the voltage reference inputs. $V_{\text {REF }} H$ mustbe equal to or less than $\mathrm{V}_{\mathrm{Cc}}$ and greater than $\mathrm{V}_{\mathrm{REF}} \mathrm{L}$.

## A0, A1, A2

The address inputs for the serial interface logic. Biasing the address inputs will determine the device's bus address that is contained within the serial data stream when communicating over the serial bus.

## SCL

The serial interface clock. It is used to clock the data in and out. When writing to the device data must remain stable while SCL is high. When reading from the device data is clocked out on the falling edge of SCL.

## SDA

The bidirectional pin used to transfer data in and out of the device.

## CS

Chip Select input $\left(\mathrm{V}_{\mathrm{IH}}=\right.$ selected $)$ in the 9210. See the Block Diagrams.

## MUTE\#

Mute input $\left(\mathrm{V}_{\mathrm{IL}}=\right.$ mute $)$ in the 9211. See the Block Diagrams.
$V_{\text {REF }}$
$V_{\text {REF }}$ output (1.25V) in the 9212 . See the Block Diagrams.
Note: NC pins are not connected.

## ABSOLUTE MAXIMUM RATINGS*

| Temperature Under Bias ................... $-55^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ |

## *Comment

Stresses listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions outside those listed in the operational sections of this specification is not implied. Exposure to any absolute maximum rating for extended periods may affect device performance and reliability.

## DC OPERATING CHARACTERISTICS

## DEVICE OPERATION

## INTRODUCTION

The device has two 10-Bit digital to analog converters that are comprised of a resistor network that converts a digital input into an equivalent analog output voltage in proportion to the applied reference voltage. The voltage differential between each of the $V_{\text {REF }} L$ and $V_{\text {REF }} H$ input pairs sets the full-scale output voltage for their respective DAC.

Each DAC has a 10-Bit volatile register that holds the current digital value. The register can be set to any value by the serial interface; commanded to load the zero scale value, full scale value or mid-scale value; or can recall a preset value stored in a nonvolatile register.
Each DAC has a 10-Bit nonvolatile register that can hold a 'set-and-forget' value that can be recalled whenever the device is powered-on.
The device also has a nonvolatile configuration register that is accessible over the 2-wire bus. The configuration register is used to select the device type identifier, the function of pin 8 and the DAC power-on state.

## ACCESSING THE DACS

The device uses the industry standard 2-wire serial protocol. The bus is designed for two-way, two-line serial communication between different integrated circuits. The two lines are the SCL (serial clock) and SDA (serial data) and both lines must be tied to the positive supply through a pull-up resistor. The protocol defines devices as being either Masters or Slaves. The SMP9210, -11, or -12 will always be a Slave because it does not initiate any communications or provide a clock output.

Data transfers are initiated when a Master issues a Start condition, which is a high to low transition on SDA while SCL is high (see Figure 1). The Start is immediately followed by an eight bit transmission: bits 7 through 1 comprise the device type identifier and bus device bus address; bit 0 is the Read/Write bit indicating the action to follow. If the intended device receives the byte and recognizes its address it will return an Acknowledge during the $9^{\text {th }}$ clock cycle. Some data transfers will be concluded with a Stop condition, which is a low to high transition on SDA while SCL is high. Note: a Stop condition must be performed for all nonvolatile Write operations. Timing for all ${ }^{2} \mathrm{C}$ operations are summarized in Figure 2 and Table 1.

The DAC device type identifier default is $0101_{\mathrm{BIN}}$. In order to accommodate more than eight devices on a single bus the device type identifier can be modified by the end user by writing to the Configuration Registers. (See page 10)

Figure 1. START and STOP Timing

Table 2. Command Structure

## SMP9210, SMP9211, SMP9212

Preliminary

The command structure is illustrated in Table 2. Of special note is the ability to write individually to either of the two DACs, or write to them both. The first three commands are three bytes in length and can either be volatile or nonvolatile.

## ACK and NACK

A device that is receiving data will respond with an Acknowledge by pulling the SDA line low (ACK) after each byte is transmitted. The transmitting device will recognize this and continue to transmit. When the Master has received the data it expects it will hold the SDA line high (NACK) and the transmitting device will end transmission.

## Sequence

The sequence is to issue a Start, followed by the device type and bus address with the Read/Write bit set to zero. The device will respond with an Acknowledge and the Master will then issue the command and follow-on data. In Figure 3 the Write is to DAC1 where the command = $1001^{\text {BIN }}$; D9 and D8 are the MSBs of the DAC value being written. The device will then respond with an Acknowl-
edge followed by the Master writing the last eight bits. If no Stop is generated after the device Acknowledge the Write is only to the register. If the device Acknowledge is followed by a Stop the data is written to both the DAC register and to the nonvolatile register.

## Reading the Device

Reading the DACs requires setting the R/W bit to one. Then the host supplies clocks and the device will output data as shown in Figure 4. PD is the Power Down mode indicator: 1 = power down, 0= DAC active. Both DACs provide their data for a single Read operation.

## Special Configurations

The SMP9210 can be configured by the end user or by Summit prior to shipment (see page 10). Reading the configuration register can also be performed if it has not already been locked. See Figure 5. There is one configuration register and it is accessed through the serial interface using 10018IN as the device type address, consequently the DAC address should never be set to 1001bin. The register is shown in Table 3.

Figure 3. DAC1 Write Operation (see Table 2)

Figure 4. Read DAC1 (See DAC2 Differentiator \& Table 2)

## CONFIGURATION REGISTER

Note: All parts are normally shipped with the Configuration Register locked. Unlocked user configurable parts are available on a special order basis. Contact the factory.

Figure 5. Configuration Register (see Table 3)

| $\begin{gathered} \hline \text { MSB } \\ \text { C7 } \end{gathered}$ | C6 | C5 | C4 | C3 | C2 | C1 | $\begin{gathered} \hline \text { LSB } \\ \text { C0 } \end{gathered}$ | Function |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X | x | x | X |  | X | X | 0 | Configuration register accessible |
|  |  |  |  |  | X | X | 1 | Configuration register locked |
|  |  |  |  |  | 0 | 0 | X | Power on recall: DACs set to all Os |
|  |  |  |  | x | 0 | 1 |  | Power on recall: DACs set to all 1s |
|  |  |  |  |  | 1 | 0 |  | Power on recall: DACs set to mid scale |
|  |  |  |  |  | 1 | 1 |  | Power on recall: DACs set to NV register |
|  |  |  |  | 0 | X | x |  | At power down $\mathrm{V}_{\text {OUt }}=$ low impedance |
|  |  |  |  | 1 |  |  |  | At power down $\mathrm{V}_{\text {OUT }}=$ high impedance |
| PDA3* | PDA2* | PDA1* | PDA0* | X |  |  |  | Programmble DAC address |

* Note: Never set the DAC address to $1001_{\text {BIN }}$. The Slave address for the
configuration register is $1001_{\text {BIN }}$, and a collision will occur on the $\mathrm{I}^{2} \mathrm{C}$ bus.

Preliminary

## PROGRAMMING CONNECTION

## HARDWARE

The end user can use the summit SMX3200 programming cable and software that have been developed to operate with a standard personal computer. The programming cable interfaces directly between a PC's parallel port and the target application. The application's values are entered via an intuitive graphical user interface employing drop-down menus.

After the desired settings for the application are determined the software will generate a hex file that can be transferred to the target device or downloaded to Summit. If it is downloaded to Summit a customer part number will be assigned and the file will be used to customize the devices during the final electrical test operations.
