

THS5651
10-BIT, 100 MSPS, CommsDAC™
DIGITAL-TO-ANALOG CONVERTER
SLAS197A – JUNE 1999

- **Member of the Pin-Compatible CommsDAC™ Product Family**
- **100 MSPS Update Rate**
- **10-Bit Resolution**
- **Superior Spurious Free Dynamic Range Performance (SFDR) to Nyquist at 20 MHz**
Output: 61 dBc
- **1 ns Setup/Hold Time**
- **Differential Scalable Current Outputs: 2 mA to 20 mA**
- **On-Chip 1.2-V Reference**
- **3 V and 5 V CMOS-Compatible Digital Interface**
- **Straight Binary or Twos Complement Input**
- **Power Dissipation: 175 mW at 5 V, Sleep Mode: 25 mW at 5 V**
- **Package: 28-Pin SOIC and TSSOP**

SOIC (DW) OR TSSOP (PW) PACKAGE
(TOP VIEW)

NC – No internal connection

The THS5651 is a 10-bit resolution digital-to-analog converter (DAC) specifically optimized for digital data transmission in wired and wireless communication systems. The 10-bit DAC is a member of the CommsDAC series of high-speed, low-power CMOS digital-to-analog converters. The CommsDAC family consists of pin compatible 14-, 12-, 10-, and 8-bit DACs. All devices offer identical interface options, small outline package and pinout. The THS5651 offers superior ac and dc performance while supporting update rates up to 100 MSPS.

The THS5651 operates from an analog supply of 4.5 V to 5.5 V. Its inherent low power dissipation of 175 mW ensures that the device is well suited for portable and low power applications. Lowering the full-scale current output reduces the power dissipation without significantly degrading performance. The device features a SLEEP mode, which reduces the standby power to approximately 25 mW, thereby optimizing the power consumption for system needs.

The THS5651 is manufactured in Texas Instruments advanced high-speed mixed-signal CMOS process. A current-source-array architecture combined with simultaneous switching shows excellent dynamic performance. On-chip edge-triggered input latches and a 1.2 V temperature compensated bandgap reference provide a complete monolithic DAC solution. The digital supply range of 3 V to 5.5 V supports 3 V and 5 V CMOS logic families. Minimum data input setup and hold times allow for easy interfacing with external logic. The THS5651 supports both a straight binary and twos complement input word format, enabling flexible interfacing with digital signal processors.

The THS5651 provides a nominal full-scale differential output current of 20 mA and >300 kΩ output impedance, supporting both single-ended and differential applications. The output current can be directly fed to the load (e.g., external resistor load or transformer), with no additional external output buffer required. An accurate on-chip reference and control amplifier allows the user to adjust this output current from 20 mA down to 2 mA, with no significant degradation of performance. This reduces power consumption and provides 20 dB gain range control capabilities. Alternatively, an external reference voltage and control amplifier may be applied in applications using a multiplying DAC. The output voltage compliance range is 1.25 V.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

description (continued)

The THS5651 is available in both a 28-pin SOIC and TSSOP package. The device is characterized for operation over the industrial temperature range of -40°C to 85°C .

AVAILABLE OPTIONS

T _A	PACKAGE	
	28-TSSOP (PW)	28-SOIC (DW)
-40°C to 85°C	THS5651IPW	THS5651IDW

functional block diagram

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
AGND	20	I	Analog ground return for the internal analog circuitry
AV _{DD}	24	I	Positive analog supply voltage (4.5 V to 5.5 V)
BIASJ	18	O	Full-scale output current bias
CLK	28	I	External clock input. Input data latched on rising edge of the clock.
COMP1	19	I	Compensation and decoupling node, requires a 0.1 μF capacitor to AV _{DD} .
COMP2	23	I	Internal bias node, requires a 0.1 μF decoupling capacitor to AGND.
D[9:0]	[1:10]	I	Data bits 0 through 9. D9 is most significant data bit (MSB), D0 is least significant data bit (LSB).
DGND	26	I	Digital ground return for the internal digital logic circuitry
DV _{DD}	27	I	Positive digital supply voltage (3 V to 5.5 V)
EXTIO	17	I/O	Used as external reference input when internal reference is disabled (i.e., EXTLO = AV _{DD}). Used as internal reference output when EXTLO = AGND, requires a 0.1 μF decoupling capacitor to AGND when used as reference output
EXTLO	16	O	Internal reference ground. Connect to AV _{DD} to disable the internal reference source
IOUT1	22	O	DAC current output. Full scale when all input bits are set 1
IOUT2	21	O	Complementary DAC current output. Full scale when all input bits are 0
MODE	25	I	Mode select. Internal pull-down. Mode 0 is selected if this pin is left floating or connected to DGND. See timing diagram.
NC	[11:14]	N	No connection
SLEEP	15	I	Asynchronous hardware power down input. Active High. Internal pull-down. Requires 5 μs to power down but 3 ms to power up.

absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

Supply voltage range, AV _{DD} (see Note 1)	–0.3 V to 6.5 V
DV _{DD} (see Note 2)	–0.3 V to 6.5 V
Voltage between AGND and DGND	–0.3 V to 0.5 V
Supply voltage range, AV _{DD} to DV _{DD}	–6.5 V to 6.5 V
CLK, SLEEP, MODE (see Note 2)	–0.3 V to DV _{DD} + 0.3 V
Digital input D9–D0 (see Note 2)	–0.3 V to DV _{DD} + 0.3 V
IOUT1, IOUT2 (see Note 1)	–1 V to AV _{DD} + 0.3 V
COMP1, COMP2 (see Note 1)	–0.3 V to AV _{DD} + 0.3 V
EXTIO, BIASJ (see Note 1)	–0.3 V to AV _{DD} + 0.3 V
EXTLO (see Note 1)	–0.3 V to 0.3 V
Peak input current (any input)	20 mA
Peak total input current (all inputs)	–30 mA
Operating free-air temperature range, T _A : THS56511	–40°C to 85°C
Storage temperature range	–65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from the case for 10 seconds	260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

APPLICATION INFORMATION

The THS5651 architecture is based on current steering, combining high update rates with low power consumption. The CMOS device consists of a segmented array of PMOS transistor current sources, which are capable of delivering a full-scale current up to 20 mA. High-speed differential current switches direct the current of each current source to either one of the output nodes, IOUT1 or IOUT2. The complementary output currents thus enable differential operation, canceling out common mode noise sources (on-chip and PCB noise), dc offsets, even order distortion components, and increase signal output power by a factor of two. Major advantages of the segmented architecture are minimum glitch energy, excellent DNL, and very good dynamic performance. The DAC's high output impedance of >300 k Ω and fast switching result in excellent dynamic linearity (spurious free dynamic range SFDR).

The full-scale output current is set using an external resistor R_{BIAS} in combination with an on-chip bandgap voltage reference source (1.2 V) and control amplifier. The current I_{BIAS} through resistor R_{BIAS} is mirrored internally to provide a full-scale output current equal to 32 times I_{BIAS} . The full-scale current can be adjusted from 20 mA down to 2 mA.

data interface and timing

The THS5651 comprises separate analog and digital supplies, i.e. AV_{DD} and DV_{DD} . The digital supply voltage can be set from 5.5 V down to 3 V, thus enabling flexible interfacing with external logic. The THS5651 provides two operating modes, as shown in Table 1. Mode 0 (mode pin connected to DGND) supports a straight binary input data word format, whereas mode 1 (mode pin connected to DV_{DD}) sets a twos complement input configuration.

Figure 20 shows the timing diagram. Internal edge-triggered flip-flops latch the input word on the rising edge of the input clock. The THS5651 provides for minimum setup and hold times (> 1 ns), allowing for noncritical external interface timing. Conversion latency is one clock cycle for both modes. The clock duty cycle can be chosen arbitrarily under the timing constraints listed in the digital specifications table. However, a 50% duty cycle will give optimum dynamic performance. Figure 21 shows a schematic of the equivalent digital inputs of the THS5651, valid for pins D9–D0, SLEEP, and CLK. The digital inputs are CMOS-compatible with logic thresholds of $DV_{DD}/2 \pm 20\%$. Since the THS5651 is capable of being updated up to 100 MSPS, the quality of the clock and data input signals are important in achieving the optimum performance. The drivers of the digital data interface circuitry should be specified to meet the minimum setup and hold times of the THS5651, as well as its required min/max input logic level thresholds. Typically, the selection of the slowest logic family that satisfies the above conditions will result in the lowest data feed-through and noise. Additionally, operating the THS5651 with reduced logic swings and a corresponding digital supply (DV_{DD}) will reduce data feed-through. Note that the update rate is limited to 67 MSPS for a digital supply voltage DV_{DD} of 3 V to 3.6 V.

APPLICATION INFORMATION

DAC transfer function

The THS5651 delivers complementary output currents IOUT1 and IOUT2. Output current IOUT1 equals the approximate full-scale output current when all input bits are set high in mode 0 (straight binary input), i.e. the binary input word has the decimal representation 1023. For mode 1, the MSB is inverted (twos complement input format). Full-scale output current will flow through terminal IOUT2 when all input bits are set low (mode 0, straight binary input). The relation between IOUT1 and IOUT2 can thus be expressed as:

$$IOUT1 = IOUT_{FS} - IOUT2$$

where $IOUT_{FS}$ is the full-scale output current. The output currents can be expressed as:

$$IOUT1 = IOUT_{FS} \times \frac{CODE}{1024}$$

$$IOUT2 = IOUT_{FS} \times \frac{(1023 - CODE)}{1024}$$

where CODE is the decimal representation of the DAC data input word. Output currents IOUT1 and IOUT2 drive resistor loads R_{LOAD} or a transformer with equivalent input load resistance R_{LOAD} . This would translate into single-ended voltages VOUT1 and VOUT2 at terminal IOUT1 and IOUT2, respectively, of:

$$VOUT1 = IOUT1 \times R_{LOAD} = \frac{CODE}{1024} \times IOUT_{FS} \times R_{LOAD}$$

$$VOUT2 = IOUT2 \times R_{LOAD} = \frac{(1023 - CODE)}{1024} \times IOUT_{FS} \times R_{LOAD}$$

The differential output voltage $VOUT_{DIFF}$ can thus be expressed as:

$$VOUT_{DIFF} = VOUT1 - VOUT2 = \frac{(2CODE - 1023)}{1024} \times IOUT_{FS} \times R_{LOAD}$$

The latter equation shows that applying the differential output will result in doubling of the signal power delivered to the load. Since the output currents of IOUT1 and IOUT2 are complementary, they become additive when processed differentially. Care should be taken not to exceed the compliance voltages at node IOUT1 and IOUT2, which would lead to increased signal distortion.

APPLICATION INFORMATION

reference operation

The THS5651 comprises a bandgap reference and control amplifier for biasing the full-scale output current. The full-scale output current is set by applying an external resistor R_{BIAS} . The bias current I_{BIAS} through resistor R_{BIAS} is defined by the on-chip bandgap reference voltage and control amplifier. The full-scale output current equals 32 times this bias current. The full-scale output current $I_{OUT_{FS}}$ can thus be expressed as:

$$I_{OUT_{FS}} = 32 \times I_{BIAS} = \frac{32 \times V_{EXTIO}}{R_{BIAS}}$$

where V_{EXTIO} is the voltage at terminal EXTIO. The bandgap reference voltage delivers an accurate voltage of 1.2 V. This reference is active when terminal EXTLO is connected to AGND. An external decoupling capacitor C_{EXT} of 0.1 μ F should be connected externally to terminal EXTIO for compensation. The bandgap reference can additionally be used for external reference operation. In that case, an external buffer with high impedance input should be applied in order to limit the bandgap load current to a maximum of 100 nA. The internal reference can be disabled and overridden by an external reference by connecting EXTLO to AVDD. Capacitor C_{EXT} may hence be omitted. Terminal EXTIO thus serves as either input or output node.

The full-scale output current can be adjusted from 20 mA down to 2 mA by varying resistor R_{BIAS} or changing the externally applied reference voltage. The internal control amplifier has a wide input range, supporting the full-scale output current range of 20 dB. The bandwidth of the internal control amplifier is defined by the internal 1 nF compensation capacitor at pin COMP1 and the external compensation capacitor C1. The relatively weak internal control amplifier may be overridden by an externally applied amplifier with sufficient drive for the internal 1 nF load, as shown in Figure 22. This provides the user with more flexibility and higher bandwidths, which are specifically attractive for gain control and multiplying DAC applications. Pin SLEEP should be connected to AGND or left disconnected when an external control amplifier is used.

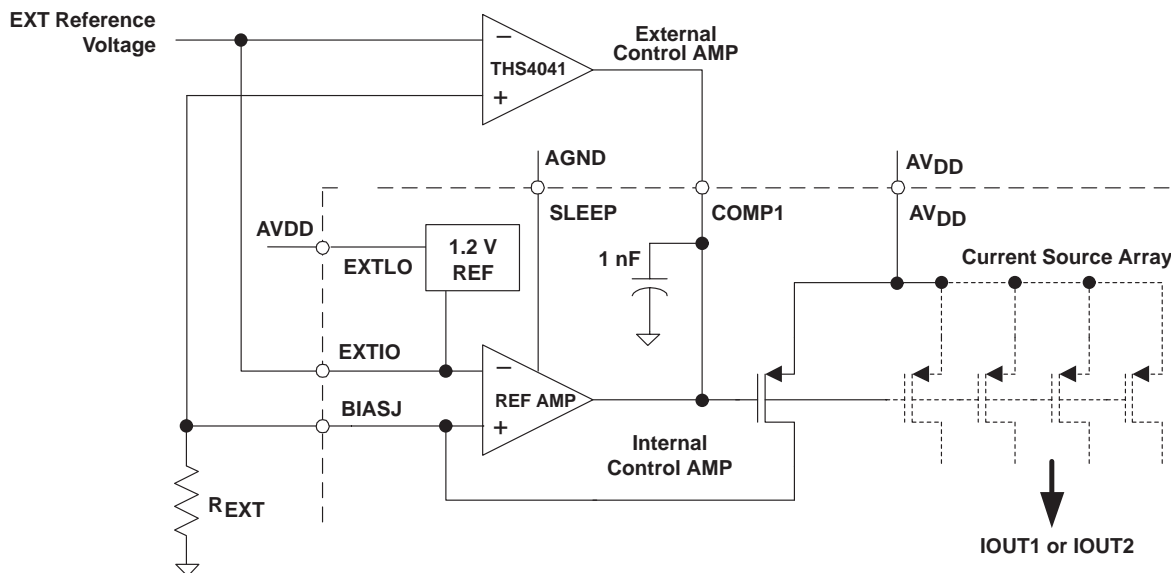

Figure 22. Bypassing the Internal Reference and Control Amplifier

APPLICATION INFORMATION

analog current outputs

Figure 23 shows a simplified schematic of the current source array output with corresponding switches. Differential PMOS switches direct the current of each individual PMOS current source to either the positive output node IOU1 or its complementary negative output node IOU2. The output impedance is determined by the stack of the current sources and differential switches, and is typically >300 kΩ in parallel with an output capacitance of 5 pF.

Output nodes IOU1 and IOU2 have a negative compliance voltage of -1 V, determined by the CMOS process. Beyond this value, transistor breakdown may occur, resulting in reduced reliability of the THS5651 device. The positive output compliance depends on the full-scale output current I_{OUTFS} and positive supply voltage AV_{DD} . The positive output compliance equals 1.25 V for $AV_{DD} = 5$ V and $I_{OUTFS} = 20$ mA. Exceeding the positive compliance voltage adversely affects distortion performance and integral nonlinearity. The optimum distortion performance for a single-ended or differential output is achieved when the maximum full-scale signal at IOU1 and IOU2 does not exceed 0.5 V (e.g. when applying a 50 Ω doubly terminated load for 20 mA full-scale output current). Applications requiring the THS5651 output (i.e., OUT1 and/or OUT2) to extend its output compliance should size R_{LOAD} accordingly.

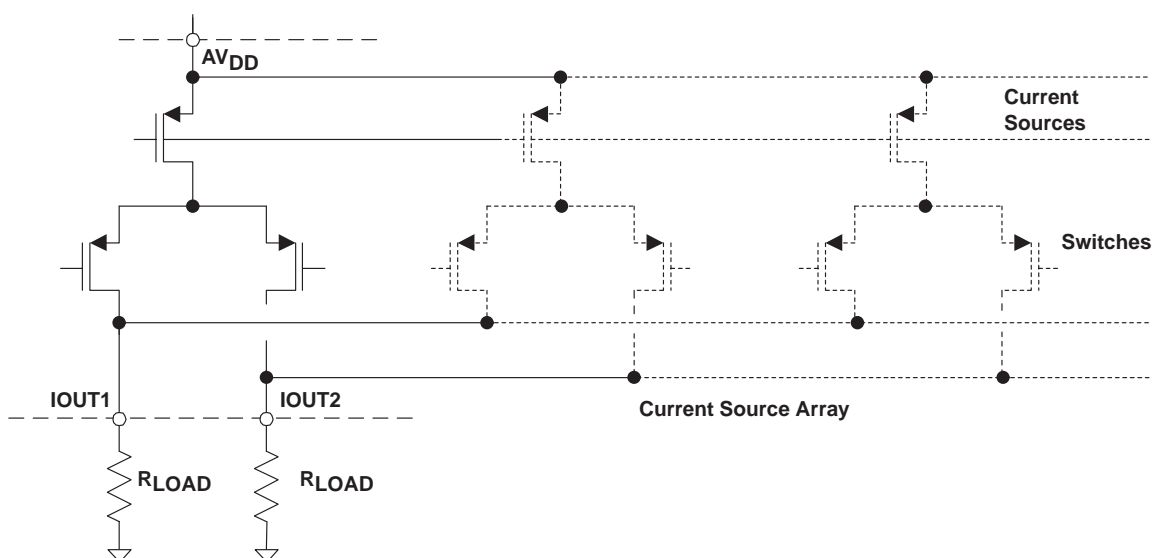

Figure 23. Equivalent Analog Current Output

Figure 24(a) shows the typical differential output configuration with two external matched resistor loads. The nominal resistor load of 50 Ω will give a differential output swing of $2 V_{PP}$ when applying a 20 mA full-scale output current. The output impedance of the THS5651 depends slightly on the output voltage at nodes IOU1 and IOU2. Consequently, for optimum dc integral nonlinearity, the configuration of Figure 24(b) should be chosen. In this I-V configuration, terminal IOU1 is kept at virtual ground by the inverting operational amplifier. The complementary output should be connected to ground to provide a dc current path for the current sources switched to IOU2. Note that the INL/DNL specifications for the THS5651 are measured with IOU1 maintained at virtual ground. The amplifier's maximum output swing and the DAC's full-scale output current determine the value of the feedback resistor R_{FB} . Capacitor C_{FB} filters the steep edges of the THS5651 current output, thereby reducing the operational amplifier slew-rate requirements. In this configuration, the op amp should operate on a dual supply voltage due to its positive and negative output swing. Node IOU1 should be selected if a single-ended unipolar output is desirable.

APPLICATION INFORMATION

Figure 24. Differential and Single-Ended Output Configuration

The THS5651 can be easily configured to drive a doubly terminated 50 Ω cable. Figure 25(a) shows the single-ended output configuration, where the output current IOUT1 flows into an equivalent load resistance of 25 Ω. Node IOUT2 should be connected to ground or terminated with a resistor of 25 Ω. Differential-to-single conversion (e.g., for measurement purposes) can be performed using a properly selected RF transformer, as shown in Figure 25(b). This configuration provides maximum rejection of common-mode noise sources and even order distortion components, thereby doubling the power to the output. The center tap on the primary side of the transformer is connected to AGND, enabling a dc current flow for both IOUT1 and IOUT2. Note that the ac performance of the THS5651 is optimum and specified using this differential transformer coupled output, limiting the voltage swing at IOUT1 and IOUT2 to ±0.5 V.

Figure 25. Driving a Doubly Terminated 50 Ω Cable

APPLICATION INFORMATION

sleep mode

The THS5651 features a power-down mode that turns off the output current and reduces the supply current to less than 5 mA over the analog supply range of 4.5 V to 5.5 V and temperature range. The power-down mode is activated by applying a logic level 1 to the SLEEP pin (e.g., by connecting pin SLEEP to AVDD). An internal pulldown circuit at node SLEEP ensures that the THS5651 is enabled if the input is left disconnected. Power-up and power-down activation times depend on the value of external capacitor at node SLEEP. For a nominal capacitor value of 0.1 μ F power down takes less than 5 μ s, and approximately 3 ms to power backup. The SLEEP mode should not be used when an external control amplifier is used, as shown in Figure 22.

definitions of specifications and terminology

integral nonlinearity (INL)

The relative accuracy or integral nonlinearity (INL), sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.

differential nonlinearity (DNL)

The differential nonlinearity (DNL), sometimes referred to as differential error, is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.

offset error

Offset error is defined as the deviation of the output current from the ideal of zero at a digital input value of 0.

gain error

Gain error is the error in slope of the DAC transfer function.

signal-to-noise ratio + distortion (S/N+D or SINAD)

S/N+D or SINAD is the ratio of the rms value of the output signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for S/N+D is expressed in decibels.

spurious free dynamic range (SFDR)

SFDR is the difference between the rms value of the output signal and the rms value of the largest spurious signal within a specified bandwidth. The value for SFDR is expressed in decibels.

total harmonic distortion (THD)

THD is the ratio of the rms sum of the first six harmonic components to the rms value of the fundamental signal and is expressed in decibels.

output compliance range

The maximum and minimum allowable voltage of the output of the DAC, beyond which either saturation of the output stage or breakdown may occur.

settling time

The time required for the output to settle within a specified error band.

glitch energy

The time integral of the analog value of the glitch transient.

THS5651
10-BIT, 100 MSPS, CommsDAC™
DIGITAL-TO-ANALOG CONVERTER
SLAS197A – JUNE 1999

offset drift

The change in offset error versus temperature from the ambient temperature ($T_A = 25^\circ\text{C}$) in ppm of full-scale range per $^\circ\text{C}$.

gain drift

The change in gain error versus temperature from the ambient temperature ($T_A = 25^\circ\text{C}$) in ppm of full-scale range per $^\circ\text{C}$.

reference voltage drift

The change in reference voltage error versus temperature from the ambient temperature ($T_A = 25^\circ\text{C}$) in ppm of full-scale range per $^\circ\text{C}$.

THS5651 evaluation board

An evaluation module (EVM) board for the THS5651 digital-to-analog converter is available for evaluation. This board allows the user the flexibility to operate the THS5651 in various configurations. Possible output configurations include transformer coupled, resistor terminated, and inverting/noninverting amplifier outputs. The digital inputs are designed to interface with the TMS320 C5000 or C6000 family of DSPs or to be driven directly from various pattern generators with the onboard option to add a resistor network for proper load termination.

See the *THS56x1 Evaluation Module User's Guide* for more details (SLAU032).

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
