

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCBS125G – JULY 1992 – REVISED JULY 1998

- Member of the Texas Instruments Widebus™ Family
- Free-Running CLKA and CLKB Can Be Asynchronous or Coincident
- Read and Write Operations Synchronized to Independent System Clocks
- Two Separate 512 × 18 Clocked FIFOs Buffering Data in Opposite Directions
- IRA and ORA Synchronized to CLKA
- IRB and ORB Synchronized to CLKB
- Microprocessor Interface Control Logic
- Programmable Almost-Full/Almost-Empty Flag
- Fast Access Times of 9 ns With a 50-pF Load and Simultaneous Switching Data Outputs
- Data Rates up to 100 MHz
- Advanced BiCMOS Technology
- Package Options Include 80-Pin Quad Flat (PH) and 80-Pin Thin Quad Flat (PN) Packages

PH PACKAGE

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCBS125G – JULY 1992 – REVISED JULY 1998

description

A FIFO memory is a storage device that allows data to be written into and read from its array at independent data rates. The SN74ABT7819 is a high-speed, low-power BiCMOS bidirectional clocked FIFO memory. Two independent 512 × 18 dual-port SRAM FIFOs on the chip buffer data in opposite directions. Each FIFO has flags to indicate empty and full conditions, a half-full flag, and a programmable almost-full/almost-empty flag.

The SN74ABT7819 is a clocked FIFO, which means each port employs a synchronous interface. All data transfers through a port are gated to the low-to-high transition of a continuous (free-running) port clock by enable signals. The continuous clocks for each port are independent of one another and can be asynchronous or coincident. The enables for each port are arranged to provide a simple bidirectional interface between microprocessors and/or buses with synchronous control.

The state of the A0–A17 outputs is controlled by \overline{CSA} and W/\overline{RA} . When both \overline{CSA} and W/\overline{RA} are low, the outputs are active. The A0–A17 outputs are in the high-impedance state when either \overline{CSA} or W/\overline{RA} is high. Data is written to FIFOA–B from port A on the low-to-high transition of CLK_A when \overline{CSA} is low, W/\overline{RA} is high, WENA is high, and the IRA flag is high. Data is read from FIFOB–A to the A0–A17 outputs on the low-to-high transition of CLK_A when \overline{CSA} is low, W/\overline{RA} is low, RENA is high, and the ORA flag is high.

description (continued)

The state of the B0–B17 outputs is controlled by $\overline{\text{CSB}}$ and $\text{W}/\overline{\text{RB}}$. When both $\overline{\text{CSB}}$ and $\text{W}/\overline{\text{RB}}$ are low, the outputs are active. The B0–B17 outputs are in the high-impedance state when either $\overline{\text{CSB}}$ or $\text{W}/\overline{\text{RB}}$ is high. Data is written to FIFOB–A from port B on the low-to-high transition of CLKB when $\overline{\text{CSB}}$ is low, $\text{W}/\overline{\text{RB}}$ is high, WENB is high, and the IRB flag is high. Data is read from FIFOA–B to the B0–B17 outputs on the low-to-high transition of CLKB when $\overline{\text{CSB}}$ is low, $\text{W}/\overline{\text{RB}}$ is low, RENB is high, and the ORB flag is high.

The setup- and hold-time constraints for the chip selects ($\overline{\text{CSA}}$, $\overline{\text{CSB}}$) and write/read selects ($\text{W}/\overline{\text{RA}}$, $\text{W}/\overline{\text{RB}}$) enable write and read operations on memory and are not related to the high-impedance control of the data outputs. If a port read enable (RENA or RENB) and write enable (WENA or WENB) are set low during a clock cycle, the chip select and write/read select can switch at any time during the cycle to change the state of the data outputs.

The input-ready (IR) and output-ready (OR) flags of a FIFO are two-stage synchronized to the port clocks for use as reliable control signals. CLKA synchronizes the status of the input-ready flag of FIFOA–B (IRA) and the output-ready flag of FIFOB–A (ORA). CLKB synchronizes the status of the input-ready flag of FIFOB–A (IRB) and the output-ready flag of FIFOA–B (ORB). When the IR flag of a port is low, the FIFO receiving input from the port is full and writes are disabled to its array. When the OR flag of a port is low, the FIFO that outputs data to the port is empty and reads from its memory are disabled. The first word loaded to an empty memory is sent to the FIFO output register at the same time its OR flag is asserted (high). When the memory is read empty and the OR flag is forced low, the last valid data remains on the FIFO outputs until the OR flag is asserted (high) again. In this way, a high on the OR flag indicates new data is present on the FIFO outputs.

The SN74ABT7819 is characterized for operation from 0°C to 70°C.

Function Tables**PORT A**

SELECT INPUTS					A0–A17	PORT-A OPERATION
CLKA	$\overline{\text{CSA}}$	$\text{W}/\overline{\text{RA}}$	WENA	RENA		
X	H	X	X	X	High Z	None
↑	L	H	H	X	High Z	Write A0–A17 to FIFOA–B
↑	L	L	X	H	Active	Read FIFOB–A to A0–A17

Terminal Functions

TERMINAL† NAME	NO.	I/O	DESCRIPTION
A0–A17	7–8, 10–11, 13–14, 16–17, 19–20, 22–23, 25–26, 28–29, 31–32	I/O	Port-A data. The 18-bit bidirectional data port for side A.
AF/AEA	3	O	FIFOA–B almost-full/almost-empty flag. Depth offsets can be programmed for AF/AEA or the default value of 128 can be used for both the almost-empty offset (X) and the almost-full offset (Y). AF/AEA is high when X or fewer words or (512 – Y) or more words are stored in FIFOA–B. AF/AEA is forced high when FIFOA–B is reset.
AF/AEB	62	O	FIFOB–A almost-full/almost-empty flag. Depth offsets can be programmed for AF/AEB or the default value of 128 can be used for both the almost-empty offset (X) and the almost-full offset (Y). AF/AEB is high when X or fewer words or (512 – Y) or more words are stored in FIFOB–A. AF/AEB is forced high when FIFOB–A is reset.
B0–B17	58–57, 55–54, 52–51, 49–48, 46–45, 43–42, 40–39, 37–36, 34–33	I/O	Port-B data. The 18-bit bidirectional data port for side B.
CLKA	76	I	Port-A clock. CLKA is a continuous clock that synchronizes all data transfers through port A to its low-to-high transition and can be asynchronous or coincident to CLKB.
CLKB	69	I	Port-B clock. CLKB is a continuous clock that synchronizes all data transfers through port B to its low-to-high transition and can be asynchronous or coincident to CLKA.
$\overline{\text{CSA}}$	80	I	Port-A chip select. $\overline{\text{CSA}}$ must be low to enable a low-to-high transition of CLKA to either write data from A0–A17 to FIFOA–B or read data from FIFOB–A to A0–A17. The A0–A17 outputs are in the high-impedance state when $\overline{\text{CSA}}$ is high.
$\overline{\text{CSB}}$	65	I	Port-B chip select. $\overline{\text{CSB}}$ must be low to enable a low-to-high transition of CLKB to either write data from B0–B17 to FIFOB–A or read data from FIFOA–B to B0–B17. The B0–B17 outputs are in the high-impedance state when $\overline{\text{CSB}}$ is high.

† Terminals listed are for the PH package.

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCBS125G – JULY 1992 – REVISED JULY 1998

Terminal Functions (Continued)

TERMINAL†		I/O	DESCRIPTION
NAME	NO.		
HFA	4	O	FIFOA–B half-full flag. HFA is high when FIFOA–B contains 256 or more words and is low when FIFOA–B contains 255 or fewer words. HFA is set low after FIFOA–B is reset.
HFB	61	O	FIFOB–A half-full flag. HFB is high when FIFOB–A contains 256 or more words and is low when FIFOB–A contains 255 or fewer words. HFB is set low after FIFOB–A is reset.
IRA	5	O	Port-A input-ready flag. IRA is synchronized to the low-to-high transition of CLKA. When IRA is low, FIFOA–B is full and writes to its array are disabled. IRA is set low during a FIFOA–B reset and is set high on the second low-to-high transition of CLKA after reset.
IRB	60	O	Port-B input-ready flag. IRB is synchronized to the low-to-high transition of CLKB. When IRB is low, FIFOB–A is full and writes to its array are disabled. IRB is set low during a FIFOB–A reset and is set high on the second low-to-high transition of CLKB after reset.
ORA	74	O	Port-A output-ready flag. ORA is synchronized to the low-to-high transition of CLKA. When ORA is low, FIFOB–A is empty and reads from its array are disabled. The last valid word remains on the FIFOB–A outputs when ORA is low. Ready data is present for the A0–A17 outputs when ORA is high. ORA is set low during a FIFOB–A reset and goes high on the third low-to-high transition of CLKA after the first word is loaded to an empty FIFOB–A.
ORB	71	O	Port-B output-ready flag. ORB is synchronized to the low-to-high transition of CLKB. When ORB is low, FIFOA–B is empty and reads from its array are disabled. The last valid word remains on the FIFOA–B outputs when ORB is low. Ready data is present for the B0–B17 outputs when ORB is high. ORB is set low during a FIFOA–B reset and goes high on the third low-to-high transition of CLKB after the first word is loaded to an empty FIFOA–B.
$\overline{\text{PENA}}$	2	I	AF/AEA program enable. After FIFOA–B is reset and before a word is written to its array, the binary value on A0–A7 is latched as an AF/AEA offset when $\overline{\text{PENA}}$ is low and CLKA is high.
$\overline{\text{PENB}}$	63	I	AF/AEB program enable. After FIFOB–A is reset and before a word is written to its array, the binary value on B0–B7 is latched as an AF/AEB offset when $\overline{\text{PENB}}$ is low and CLKB is high.
RENA	75	I	Port-A read enable. A high level on RENA enables data to be read from FIFOB–A on the low-to-high transition of CLKA when $\overline{\text{CSA}}$ is low, $\overline{\text{W/RA}}$ is low, and ORA is high.
RENB	70	I	Port-B read enable. A high level on RENB enables data to be read from FIFOA–B on the low-to-high transition of CLKB when $\overline{\text{CSB}}$ is low, $\overline{\text{W/RB}}$ is low, and ORB is high.
$\overline{\text{RSTA}}$	1	I	FIFOA–B reset. To reset $\overline{\text{FIFOA–B}}$, four low-to-high transitions of CLKA and four low-to-high transitions of CLKB must occur while $\overline{\text{RSTA}}$ is low. This sets HFA low, IRA low, ORB low, and AF/AEA high.
$\overline{\text{RSTB}}$	64	I	FIFOB–A reset. To reset $\overline{\text{FIFOB–A}}$, four low-to-high transitions of CLKA and four low-to-high transitions of CLKB must occur while $\overline{\text{RSTB}}$ is low. This sets HFB low, IRB low, ORA low, and AF/AEB high.
WENA	77	I	Port-A write enable. A high level on WENA enables data on A0–A17 to be written into FIFOA–B on the low-to-high transition of CLKA when $\overline{\text{W/RA}}$ is high, $\overline{\text{CSA}}$ is low, and IRA is high.
WENB	68	I	Port-B write enable. A high level on WENB enables data on B0–B17 to be written into FIFOB–A on the low-to-high transition of CLKB when $\overline{\text{W/RB}}$ is high, $\overline{\text{CSB}}$ is low, and IRB is high.
$\overline{\text{W/RA}}$	79	I	Port-A write/read select. A high on $\overline{\text{W/RA}}$ enables A0–A17 data to be written to FIFOA–B on a low-to-high transition of CLKA when WENA is high, $\overline{\text{CSA}}$ is low, and IRA is high. A low on $\overline{\text{W/RA}}$ enables data to be read from FIFOB–A on a low-to-high transition of CLKA when RENA is high, $\overline{\text{CSA}}$ is low, and ORA is high. The A0–A17 outputs are in the high-impedance state when $\overline{\text{W/RA}}$ is high.
$\overline{\text{W/RB}}$	66	I	Port-B write/read select. A high on $\overline{\text{W/RB}}$ enables B0–B17 data to be written to FIFOB–A on a low-to-high transition of CLKB when WENB is high, $\overline{\text{CSB}}$ is low, and IRB is high. A low on $\overline{\text{W/RB}}$ enables data to be read from FIFOA–B on a low-to-high transition of CLKB when RENB is high, $\overline{\text{CSB}}$ is low, and ORB is high. The B0–B17 outputs are in the high-impedance state when $\overline{\text{W/RB}}$ is high.

† Terminals listed are for the PH package.

NOTES: A. $\overline{CSA}, \overline{CSB} = 0, W\overline{RA} = 1, W\overline{RB} = 0$
 B. X is the almost-empty offset and Y is the almost-full offset for AF/AEA.
 C. HFB and AF/AEB function in the same manner for FIFO B-A.

Figure 8. FIFOA - B (HFA, AF/AEA) Asynchronous Flag Timing

offset values for AF/AE

The AF/AE flag of each FIFO has two programmable limits: the almost-empty offset value (X) and the almost-full offset value (Y). They can be programmed from the input of the FIFO after it is reset and before a word is written to its memory. An AF/AE flag is high when its FIFO contains X or fewer words or (512 – Y) or more words.

To program the offset values for AF/AEA, $\overline{PEN_A}$ is brought low after FIFOA–B is reset and only when CLKA is low. On the following low-to-high transition of CLKA, the binary value on A0–A7 is stored as the almost-empty offset value (X) and the almost-full offset value (Y). Holding $\overline{PEN_A}$ low for another low-to-high transition of CLKA reprograms Y to the binary value on A0–A7 at the time of the second CLKA low-to-high transition.

During the first two CLKA cycles used for offset programming, $\overline{PEN_A}$ can be brought high only when CLKA is low. $\overline{PEN_A}$ can be brought high at any time after the second CLKA pulse used for offset programming returns low. A maximum value of 255 can be programmed for either X or Y (see Figure 9). To use the default values of X = Y = 128, $\overline{PEN_A}$ must be tied high. No data is stored in FIFOA–B while the AF/AEA offsets are programmed. The AF/AEB flag is programmed in the same manner, with $\overline{PEN_B}$ enabling CLKB to program the offset values taken from B0–B7.

Figure 9. Programming X and Y Separately for AF/AEA

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC}	–0.5 V to 7 V
Input voltage range, V_I (see Note 1)	–0.5 V to $V_{CC} + 0.5$ V
Voltage range applied to any output in the high state or power-off state, V_O	–0.5 V to 5.5 V
Current into any output in the low state, I_O	48 mA
Input clamp current, I_{IK} ($V_I < 0$)	–18 mA
Output clamp current, I_{OK} ($V_O < 0$)	–50 mA
Package thermal impedance, θ_{JA} (see Note 2): PH package	76°C/W
PN package	62°C/W
Storage temperature range, T_{stg}	–65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
2. The package thermal impedance is calculated in accordance with JESD 51.

recommended operating conditions

	W/RB		2.5		8	2.5	8	2.5	9	2.5	10	2.5	11	

† All typical values are at $V_{CC} = 5$ V, $T_A = 25^\circ\text{C}$.

‡ This parameter is measured with a 30-pF load (see Figure 11).

PARAMETER MEASUREMENT INFORMATION

NOTE A: CL includes probe and jig capacitance.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
