SN74ACT7811
1024 × 18
CLOCKED FIRST-IN, FIRST-OUT MEMORY

SCAS151C – JANUARY 1991 – REVISED FEBRUARY 1996

- **Member of the Texas Instruments Widebus™ Family**
- **Independent Asynchronous Inputs and Outputs**
- **1024 Words × 18 Bits**
- **Read and Write Operations Can Be Synchronized to Independent System Clocks**
- **Programmable Almost-Full/Almost-Empty Flag**
- **Pin-to-Pin Compatible With SN74ACT7881, SN74ACT7882, and SN74ACT7884**
- **Input-Ready, Output-Ready, and Half-Full Flags**
- **Cascadable in Word Width and/or Word Depth**
- **Fast Access Times of 15 ns With a 50-pF Load**
- **High-Output Drive for Direct Bus Interface**
- **Available in 68-Pin PLCC (FN) and Space-Saving 80-Pin Thin Quad Flat (PN) Packages**

NC – No internal connection

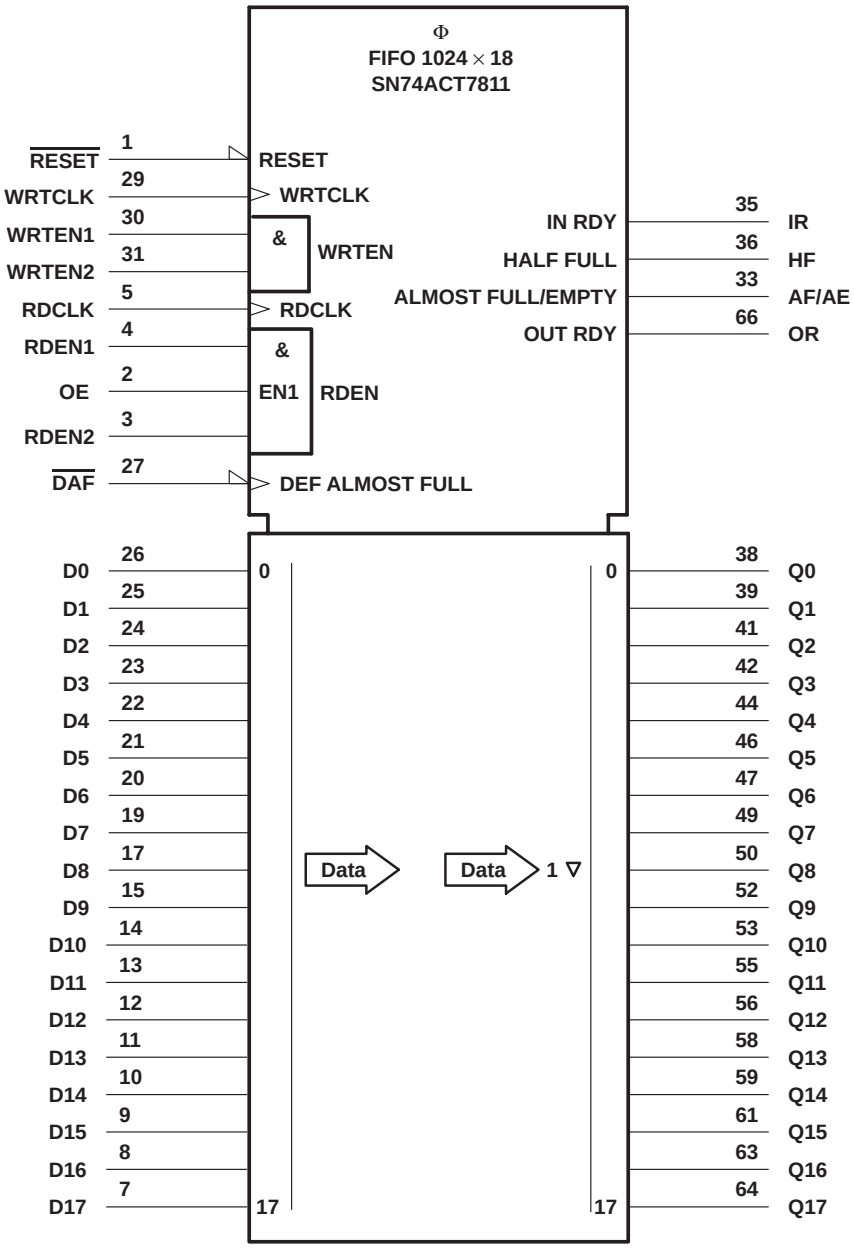
description

A FIFO memory is a storage device that allows data to be written into and read from its array at independent data rates. The SN74ACT7811 is a 1024 × 18-bit FIFO for high speed and fast access times. It processes data at rates up to 40 MHz and access times of 15 ns in a bit-parallel format. Data outputs are noninverting with respect to the data inputs. Expansion is easily accomplished in both word width and word depth.

The SN74ACT7811 has normal input-bus-to-output-bus asynchronous operation. The special enable circuitry adds the ability to synchronize independent read and write (interrupts or requests) to their respective system clock.

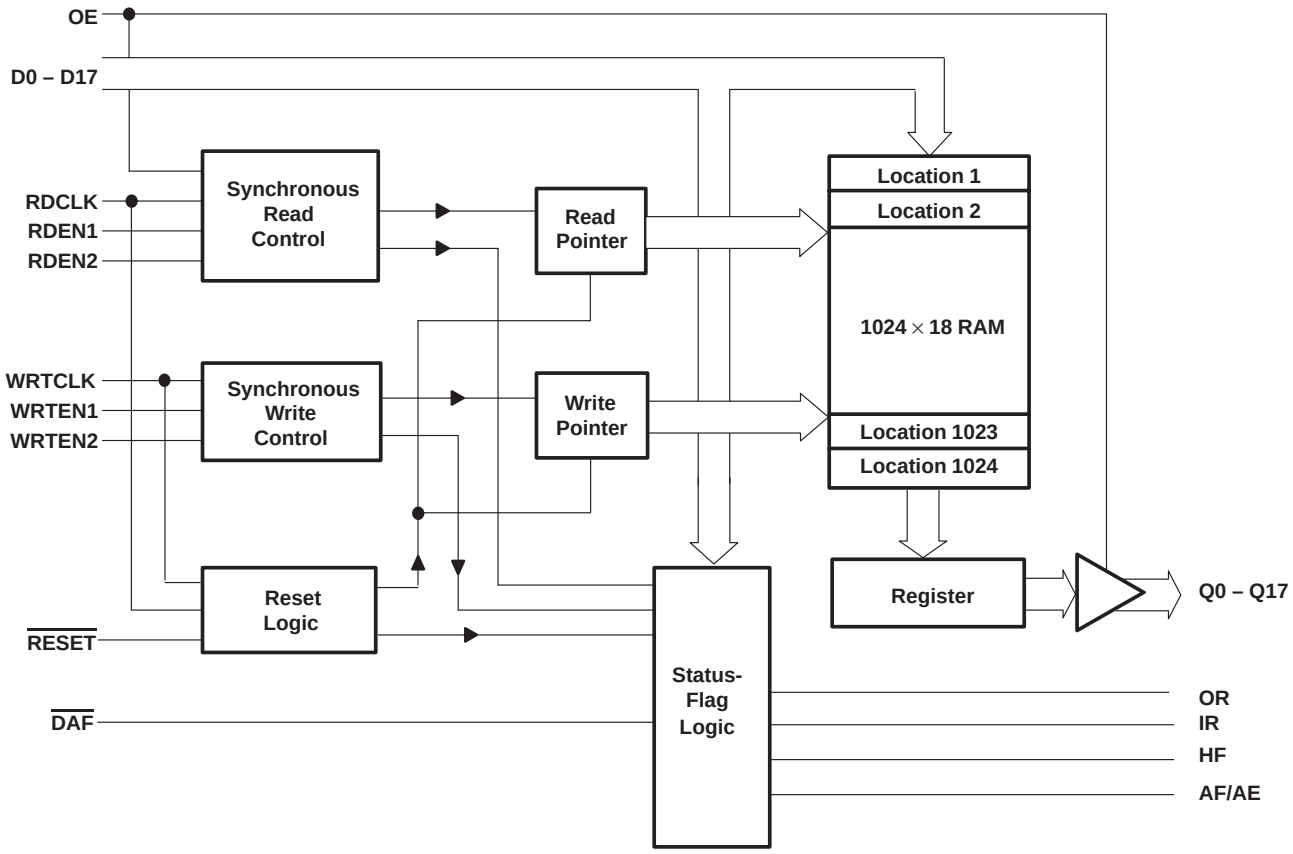
The SN74ACT7811 is characterized for operation from 0°C to 70°C.

logic symbol†



† This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12.
Pin numbers shown are for the FN package.

functional block diagram



Terminal Functions

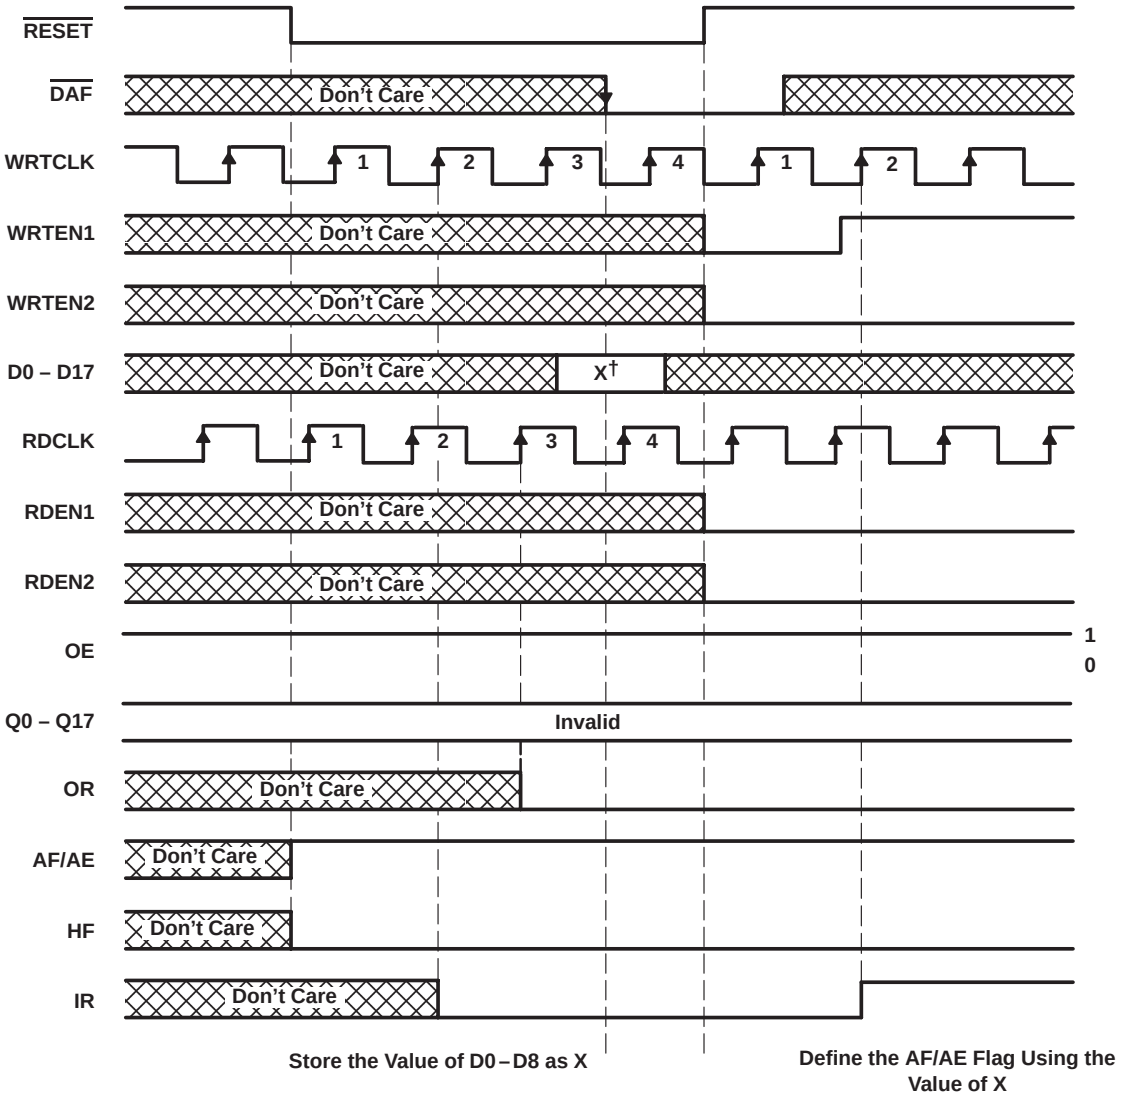
TERMINAL† NAME	TERMINAL† NO.	I/O	DESCRIPTION
AF/AE	33	O	Almost-full/almost-empty flag. The AF/AE boundary is defined by the almost-full/almost-empty offset value (X). This value can be programmed during reset or the default value of 256 can be used. AF/AE is high when the FIFO contains (X + 1) or less words or (1025 – X) or more words. AF/AE is low when the FIFO contains between (X + 2) and (1024 - X) words. Programming procedure for AF/AE – The almost-full/almost-empty flag is programmed during each reset cycle. The almost-full/almost-empty offset value (X) is either a user-defined value or the default of X = 256. Instructions to program AF/AE using both methods are as follows: User-defined X Step 1: Take $\overline{\text{DAF}}$ from high to low. Step 2: If $\overline{\text{RESET}}$ is not already low, take $\overline{\text{RESET}}$ low. Step 3: With $\overline{\text{DAF}}$ held low, take $\overline{\text{RESET}}$ high. This defines the AF/AE using X. Step 4: To retain the current offset for the next reset, keep $\overline{\text{DAF}}$ low. Default X To redefine AF/AE using the default value of X = 256, hold $\overline{\text{DAF}}$ high during the reset cycle.
$\overline{\text{DAF}}$	27	I	Define almost full. The high-to-low transition of $\overline{\text{DAF}}$ stores the binary value of data inputs as the almost-full/almost-empty offset value (X). With $\overline{\text{DAF}}$ held low, a low pulse on $\overline{\text{RESET}}$ defines the AF/AE flag using X.
D0–D17	26–19, 17, 15–7	I	Data inputs for 18-bit-wide data to be stored in the memory. Data lines D0–D8 also carry the almost-full/almost-empty offset value (X) on a high-to-low transition of the $\overline{\text{DAF}}$.
HF	36	O	Half-full flag. HF is high when the FIFO contains 513 or more words and is low when it contains 512 or less words.
IR	35	O	Input-ready flag. IR is high when the FIFO is not full and low when the device is full. During reset, IR is driven low on the rising edge of the second WRTCLK pulse. IR is then driven high on the rising edge of the second WRTCLK pulse after $\overline{\text{RESET}}$ goes high. After the FIFO is filled and IR is driven low, IR is driven high on the second WRTCLK pulse after the first valid read.
OE	2	I	Output enable. The data-out (Q0–Q17) outputs are in the high-impedance state when OE is low. OE must be high before the rising edge of RDCLK to read a word from memory.
OR	66	O	Output-ready flag. OR is high when the FIFO is not empty and low when it is empty. During reset, OR is set low on the rising edge of the third RDCLK pulse. OR is set high on the rising edge of the third RDCLK pulse to occur after the first word is written into the FIFO. OR is set low on the rising edge of the first RDCLK pulse after the last word is read.
Q0–Q17	38–39, 41–42, 44, 46–47, 49–50, 52–53, 55–56, 58–59, 61, 63–64	O	Data outputs. The first data word to be loaded into the FIFO is moved to Q0–Q17 on the rising edge of the third RDCLK pulse to occur after the first valid write. The RDEN1 and RDEN2 inputs do not affect this operation. Following data is unloaded on the rising edge of RDCLK when RDEN1, RDEN2, OE, and the OR are high.
RDCLK	5	I	Read clock. Data is read out of memory on a low-to-high transition RDCLK if OR, OE, and RDEN1 and RDEN2 control inputs are high. RDCLK is a free-running clock and functions as the synchronizing clock for all data transfers out of the FIFO. OR is also driven synchronously with respect to RDCLK.
RDEN1, RDEN2	4 3	I	Read enable. RDEN1 and RDEN2 must be high before a rising edge on RDCLK to read a word out of memory. RDEN1 and RDEN2 are not used to read the first word stored in memory.
$\overline{\text{RESET}}$	1	I	A reset is accomplished by taking $\overline{\text{RESET}}$ low and generating a minimum of four RDCLK and WRTCLK cycles. This ensures that the internal read and write pointers are reset and OR, HF, and IR are low and AF/AE is high. The FIFO must be reset upon power up. With $\overline{\text{DAF}}$ at a low level, a low pulse on $\overline{\text{RESET}}$ defines the AF/AE status flag using the almost-full/almost-empty offset value (X), where X is the value previously stored. With $\overline{\text{DAF}}$ at a high level, a low-level pulse on $\overline{\text{RESET}}$ defines the AF/AE flag using the default value of X = 256.

† Terminals listed are for the FN package.

Terminal Functions (Continued)

TERMINAL† NAME	TERMINAL† NO.	I/O	DESCRIPTION
WRTCLK	29	I	Write clock. Data is written into memory on a low-to-high transition of WRTCLK if IR, WRTEN1, and WRTEN2 are high. WRTCLK is a free-running clock and functions as the synchronizing clock for all data transfers into the FIFO. IR is also driven synchronously with respect to WRTCLK.
WRTEN1, WRTEN2	30 31	I	Write enables. WRTEN1 and WRTEN2 must be high before a rising edge on WRTCLK for a word to be written into memory. WRTEN1 and WRTEN2 do not affect the storage of the almost-full/almost-empty offset value (X).

† Terminals listed are for the FN package.



† X is the binary value of D0 – D8 only.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC} . . . . . –0.5 V to 7 V
Input voltage, V_I . . . . . 7 V
Voltage applied to a disabled 3-state output . . . . . 5.5 V
Operating free-air temperature range, T_A . . . . . 0°C to 70°C
Storage temperature range, T_{stg} . . . . . –65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

recommended operating conditions

		MIN	MAX	UNIT

calculating power dissipation

The maximum power dissipation (P_T) of the SN74ACT7811 can be calculated by:

$$P_T = V_{CC} \times [I_{CC} + (N \times \Delta I_{CC} \times dc)] + \Sigma (C_{pd} \times V_{CC}^2 \times f_i) + \Sigma (C_L \times V_{CC}^2 \times f_o)$$

where:

I_{CC}	=	power-down I_{CC} maximum
N	=	number of inputs driven by a TTL device
ΔI_{CC}	=	increase in supply current
dc	=	duty cycle of inputs at a TTL high level of 3.4 V
C_{pd}	=	power dissipation capacitance
C_L	=	output capacitive load
f_i	=	data input frequency
f_o	=	data output frequency

APPLICATION INFORMATION

expanding the SN74ACT7811

The SN74ACT7811 is expandable in width and depth. Expanding in word depth offers special timing considerations:

After the first data word is loaded into the FIFO, the word is unloaded and the output-ready flag (OR) output goes high after (N × 3) read-clock (RDCLK) cycles, where N is the number of devices used in depth expansion.

After the FIFO is filled, the input-ready flag (IR) output goes low, the first word is unloaded, and the IR flag output is driven high after (N × 2) write-clock cycles, where N is the number of devices used in depth expansion.
