description

The TPIC6A595 is a monolithic, high-voltage, high-current power logic 8-bit shift register designed for use in systems that require relatively high load power. The device contains a built-in voltage clamp on the outputs for inductive transient protection. Power driver applications include relays, solenoids, and other medium-current or high-voltage loads. Each open-drain DMOS transistor features an independent chopping current-limiting circuit to prevent damage in the case of a short circuit.

This device contains an 8-bit serial-in, parallel-out shift register that feeds an 8-bit, D-type storage register. Data transfers through both the shift and storage registers on the rising edge of the shift-register clock (SRCK) and the register clock (RCK), respectively. The storage register transfers data to the output buffer when shift-register clear ($\overline{\text{SRCLR}}$) is high. When $\overline{\text{SRCLR}}$ is low, the input shift register is cleared. When output enable ($\overline{\text{G}}$) is held high, all data in the output buffers is held low and all drain outputs are off. When $\overline{\text{G}}$ is held low, data from the storage register is transparent to the output buffers. The serial output (SER OUT) allows for cascading of the data from the shift register to additional devices.

Outputs are low-side, open-drain DMOS transistors with output ratings of 50 V and a 350-mA continuous sink current capability. When data in the output buffers is low, the DMOS-transistor outputs are off. When data is high, the DMOS-transistor outputs have sink current capability.

Separate power ground (PGND) and logic ground (LGND) terminals are provided to facilitate maximum system flexibility. All PGND terminals are internally connected, and each PGND terminal must be externally connected to the power system ground in order to minimize parasitic impedance. A single-point connection between LGND and PGND must be made externally in a manner that reduces crosstalk between the logic and load circuits.

The TPIC6A595 is offered in a thermally-enhanced dual-in-line (NE) package and a wide-body surface-mount (DW) package. The TPIC6A595 is characterized for operation over the operating case temperature range of –40°C to 125°C.

Storage temperature range, T_{stg}	–65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. All voltage values are with respect to LGND and PGND.
2. Each power DMOS source is internally connected to PGND.
3. Pulse duration ≤ 100 µs and duty cycle ≤ 2 %.
4. DRAIN supply voltage = 15 V, starting junction temperature (T_{JS}) = 25°C, L = 210 mH, I_{AS} = 600 mA (see Figure 6).

PARAMETER MEASUREMENT INFORMATION

First output current pulses after turn-on in chopping mode with resistive load.

NOTES: A. Figure 3 illustrates the output current characteristics of the device energizing a load having initially low, increasing resistance, e.g., an incandescent lamp. In region 1, chopping occurs and the peak current is limited to I_{OK}. In region 2, output current is continuous. The same characteristics occur in reverse order when the device energizes a load having an initially high, decreasing resistance.
B. Region 1 duty cycle is approximately 2%.

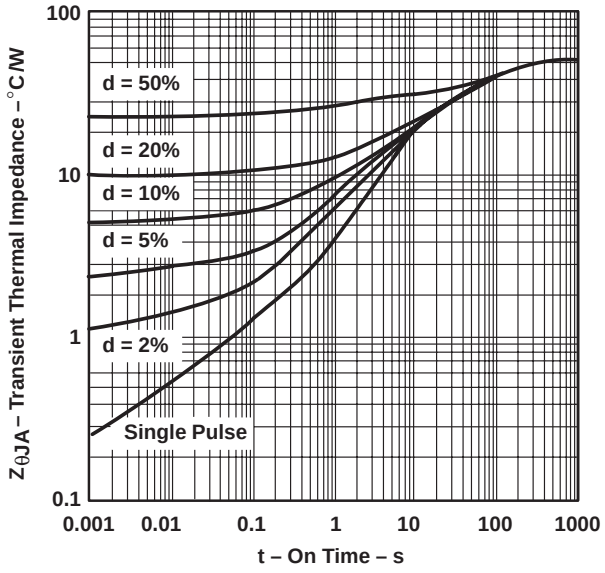
THERMAL INFORMATION

NE PACKAGE TRANSIENT THERMAL IMPEDANCE vs ON TIME



The single-pulse curve represents measured data. The curves for various pulse durations are based on the following equation:

$$Z_{\theta JA} = \left| \frac{t_w}{t_c} \right| R_{\theta JA} + \left| 1 - \frac{t_w}{t_c} \right| Z_\theta(t_w + t_c) + Z_\theta(t_w) - Z_\theta(t_c)$$

Where:

$Z_\theta(t_w)$ = the single-pulse thermal impedance for t = t_w seconds

$Z_\theta(t_c)$ = the single-pulse thermal impedance for t = t_c seconds

$Z_\theta(t_w + t_c)$ = the single-pulse thermal impedance for t = $t_w + t_c$ seconds

$d = t_w/t_c$
