

CMOS 4-BIT MICROCONTROLLER

TMP47C423AF

The 47C423A is a high speed and high performance 4-bit single chip microcomputer based on the TLC5-47 CMOS series with LCD driver, High Speed Event Counter and Pulse output circuit.

PART No.	ROM	RAM	PACKAGE
TMP47C423AF	4096 x 8-bit	256 x 4-bit	QFP64

FEATURES

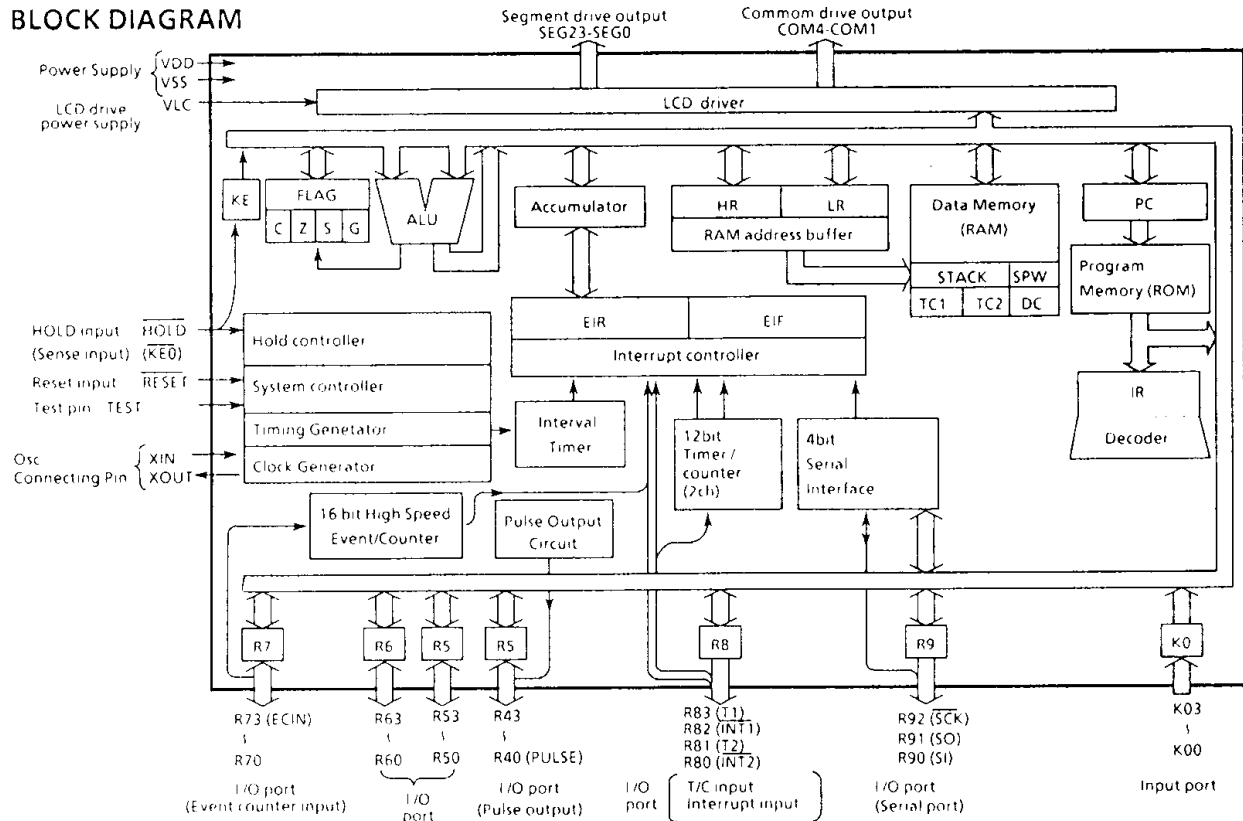

- ◆ 4-bit single chip microcomputer
- ◆ Instruction execution time : 1.9 μ s (at 4.2MHz)
- ◆ 89 basic instructions
- ◆ Table look-up instructions
- ◆ Subroutine nesting : 15 levels max.
- ◆ 6 interrupt sources (External: 2, Internal: 4)
 - All sources have independent latches each, and multiple interrupt control is available.
- ◆ I/O port (28 pins)
 - Input 2ports 5pins
 - I/O 6ports 23pins
- ◆ Interval Timer
- ◆ Two 12-bit Timer/Counters
 - Timer, event counter, and pulse width measurement mode
- ◆ 16 bit High Speed Event Counter
- ◆ Serial Interface with 4-bit buffer
 - External/Internal colck, and leading/training edge shift mode
- ◆ LCD driver
 - LCD direct drive is available (Max.12-digit display at 1/4 duty LCD)
 - 1/4, 1/3, 1/2 duties or static drive programmably selectable.
- ◆ Pulse Output
 - Output frequency select
- ◆ High current output ports
 - Sink current (typ. 20mA x 2bit)
 - Source current (typ. - 20mA x 2bit)
- ◆ Hold function
 - Battery/Capacitor back-up
- ◆ Real Time Emulator : BM47219A

PIN ASSIGNMENT (TOP VIEW)

BLOCK DIAGRAM

PIN FUNCTION

PIN NAME	Input / Output	FUNCTIONS	
K03 - K00	Input	4-bit input port	
R43 - R41	I/O	4-bit I/O port with latch.	
R40 (PULSE)	I/O (Output)	When using as pulse output, the latch must be set to "1".	Pulse output
R53 - R50	I/O	4-bit I/O port with latch.	
R63 - R60		When using as input port, the latch must be set to "1".	
R73 (ECIN)	I/O (Input)	4-bit I/O port with latch.	High Speed Event Contor Input
R72 - R70	I/O	When using High speed even/counter, the latch must be set to "1".	
R83 (T1)	I/O (Input)	4-bit I/O port with latch.	Timer/Counter 1 external input
R82 ($\overline{\text{INT}}1$)		When used as input port, external interrupt	External interrupt 1 input
R81 (T2)		input pin, or timer/counter external input	Timer/Counter 2 external input
R80 ($\overline{\text{INT}}2$)		pin, the latch must be set to "1".	External interrupt 2 input
R92 ($\overline{\text{SCK}}$)	I/O (I/O)	3-bit I/O port with latch.	Serial clock I/O
R91 (SO)	I/O (Output)	When used as input port or serial port,	Serial data output
R90 (SI)	I/O (Input)	the latch must be set to "1".	Serial data input
SEG23-SEG0	Output	LCD Segment drive output	
COM4-COM1		LCD Common drive output	
XIN	input	Resonator connecting pin.	
XOUT	Output	For inputting external clock, XIN is used and XOUT is opened.	
RESET	Input	Reset signal input	
HOLD ($\overline{\text{KE}}0$)	Input (Input)	Hold request/release signal input	Sense input
TEST	Input	Test pin for out-going test. Be opened or fixed to low level.	
VDD	Power supply	+5V	
VSS		0V (GND)	
VLC		LCD drive power supply	

OPERATIONAL DESCRIPTION

Concerning the 47C423A the configuration and functions of hardware are described. As the description has been provided with priority on those parts differing from the 47C400A, technical data sheets for the 47C400A shall also be referred to.

1. SYSTEM CONFIGURATION

- (1) I/O Port
- (2) Timer/Counter
- (3) LCD driver
- (4) High Speed Event Counter
- (5) Pulse output

2. PERIPHERAL HARDWARE FUNCTION

2.1 I/O Ports

The 47C423A has 8 I/O ports (28 pins) each as follows:

- ① K0 ; 4-bit input
- ② R4 ; 4-bit input/output (R40 pin is shared with pulse output)
- ③ R5, R6 ; 4-bit input/output
- ④ R7 ; 4-bit input/output (R73 pin is shared with pulse output)
- ⑤ R8 ; 4-bit input/output (Shared with external interrupt input and timer/counter input)
- ⑥ R9 ; 3-bit input/output (Shared with serial port)
- ⑦ KE ; 1-bit Sense input (Shared with hold request/release signal input)

As the description has been provided with priority on ports (②), (④) and (⑥) changed from 47C400A. Further, 47C423 has not P1, P2 port, Therefore, the instruction [OUTB @ HL] and 5bit to 8bit data conversion table cannot be used.

Table 2-1, lists the port address assignment and the I/O instruction that can access the port.

Port Address (**)	Port		Input / output instruction							
	input (IP**)	Output (OP**)	IN %p, A IN %p, @HL	OUT A, %p OUT @HL, %p	OUT #, %p	OUTB @HL	SET %p, b CLR %p, b	TEST %p, b TESTP %p, b	SET @L CLR @L TEST @L

Note 1. "—" means the reserved state. Unavailable for the user programs.

Note 2. Bits 3 of IP09 is used for a status register of the High Speed Event/Counter (HEC).

Table 3-1. Port Address Assignments and Available I/O Instruction

(1) Port R4 (R43-R40)

The 4-bit I/O ports with a latch. When used as an input port, the latch should be set to "1". The latch is initialized to "1" during reset. R40 pin is shared by pulse output pin. To use this pin for the functional pin, the latch must be set to "1". To use it for an ordinary I/O pin, the acceptance of pulse output must be disabled.

Figure 2-1. Port R4

(2) Port R7 (R73-R70)

The 4-bit I/O ports with a latch. When used as an input port, the latch should be set to "1". The latch is initialized to "1" during reset. R73 pin is shared by High speed event input pin. To use this pin for the functional pin, the latch must be set to "1". To use it for an ordinary I/O pin, the acceptance of High speed event counter must be disabled.

Figure 2-2. Port R7

(3) Port R9 (R92-R90)

The 3-bit I/O port with a latch. That pin R93 does not exist. R93 input port is used for a status register of the High Speed Event/Counter. In detail a chapter of High Speed Event/Counter shall also be referred to. All else is the same as for the 47C400A.

2.2 Timer Counter (TC1, TC2)

The timer/counter of 47C423A is similar to that of the 47C400A except for the following point. The maximum frequency applied to the external input pin under the event counter mode is dependent upon the operating state of the LCD drive circuit.

Operating State of the LCD driver	Maximum frequency applied [Hz]			
	1-channel operation		2-channel operation	
	TC1	TC2	TC1	TC2
At time of blanking operation	$f_c / 32$		$f_c / 32$	$f_c / 40$
When LCD display is enabled	$f_c / 64$		$f_c / 72$	

Note f_c ; Basic clock frequency

Table 2-2. The maximum frequency applied to external input pin under the event counter mode.

2.3 LCD Driver

The 47C423A has the built-in circuit that directly drives the liquid crystal display (LCD) and its control circuit. The 47C423A has the following connecting pins with LCD.

- ① Segment output port 24pins (SEG23-SEG0)
- ② Common output port 4pins (COM4-COM1)

In addition, VLC pins is provided as the drive power pin.

The devices that can be directly driven is selectable from LCD of following drive methods.

- ① 1/4 DUTY (1/3 Bias) LCD MAX. 96 segments (8 segments × 12 disits)
- ② 1/3 DUTY (1/3 Bias) LCD MAX. 72 segments (8 segments × 9 disits)
- ③ 1/2 DUTY (1/2 Bias) LCD MAX. 48 segments (8 segments × 6 disits)
- ④ Static LCD MAX. 24 segments (8 segments × 3 disits)

2.3.1 Configuration of LCD driver

Figure 2-3. shows the configuration of the LCD driver.

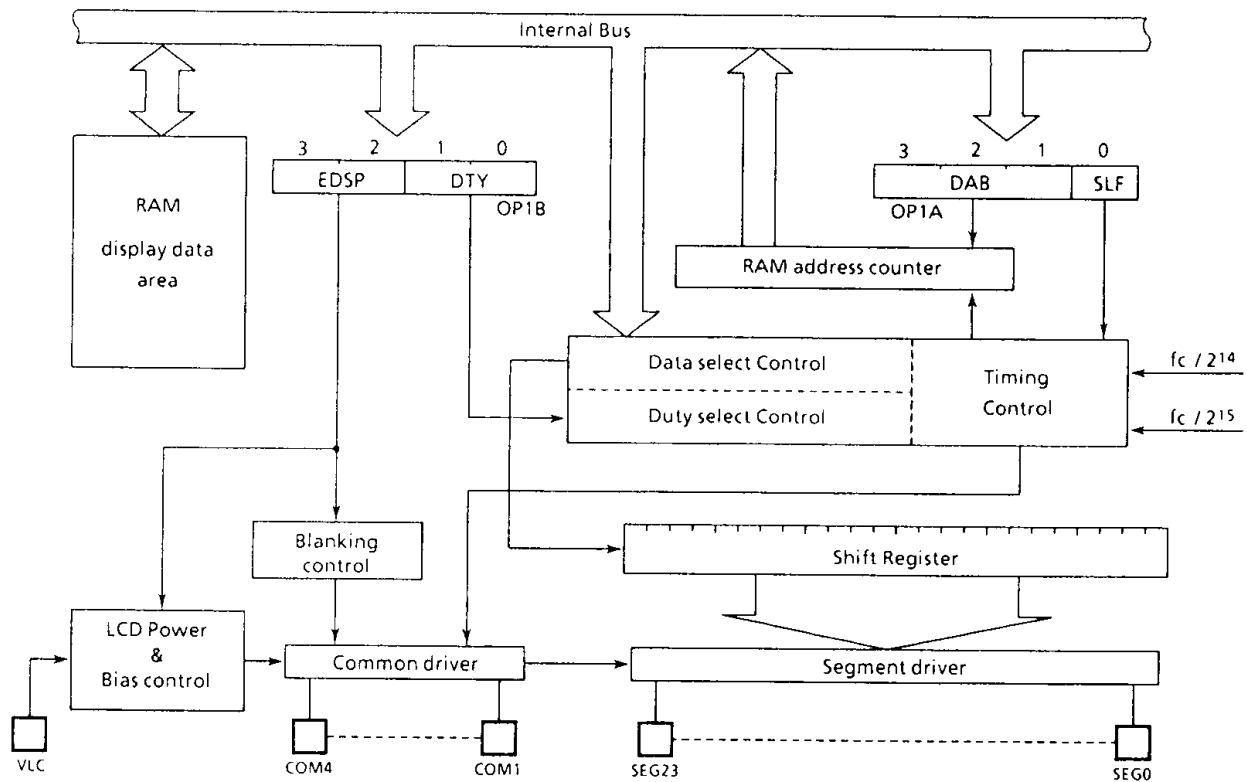

Figure 2-3. Configuration of LCD driver

2.3.2 Control of LCD driver

The LCD driver is controlled by the command register 1, 2 (OP1A, OP1B)

Further, when the command register 1 is accessed, the most significant bit of the command register 2 must be set to "0" (Blanking or Designation of driving methods).

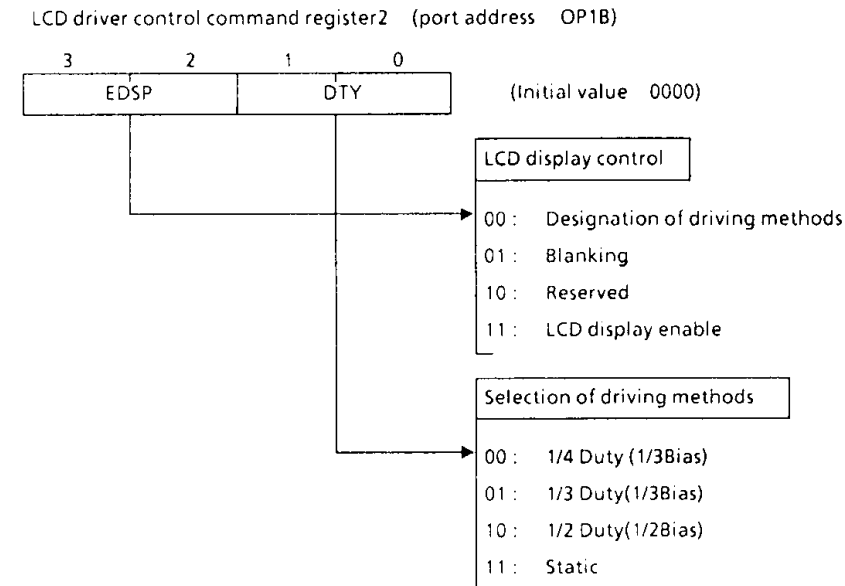

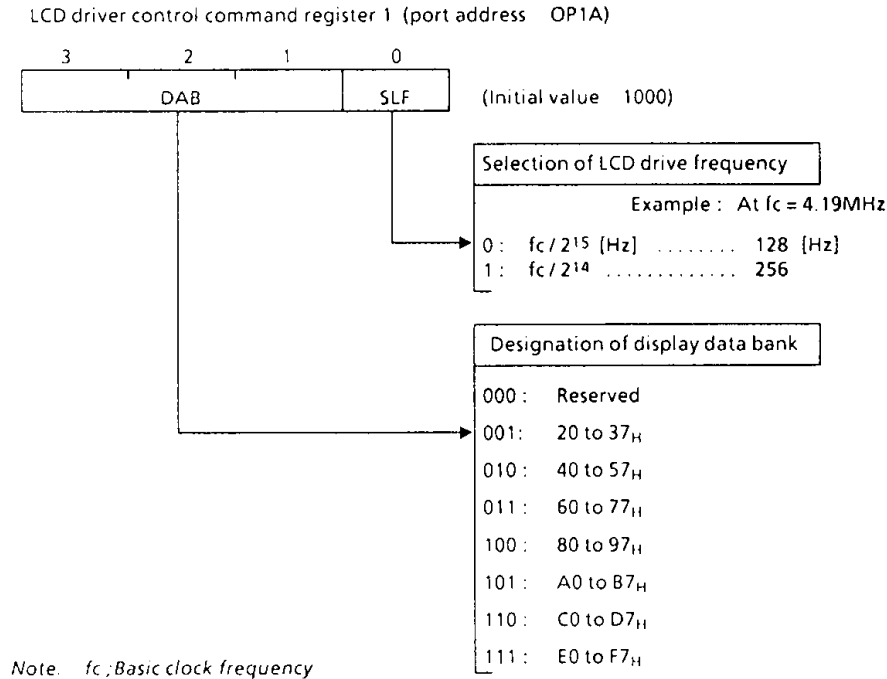

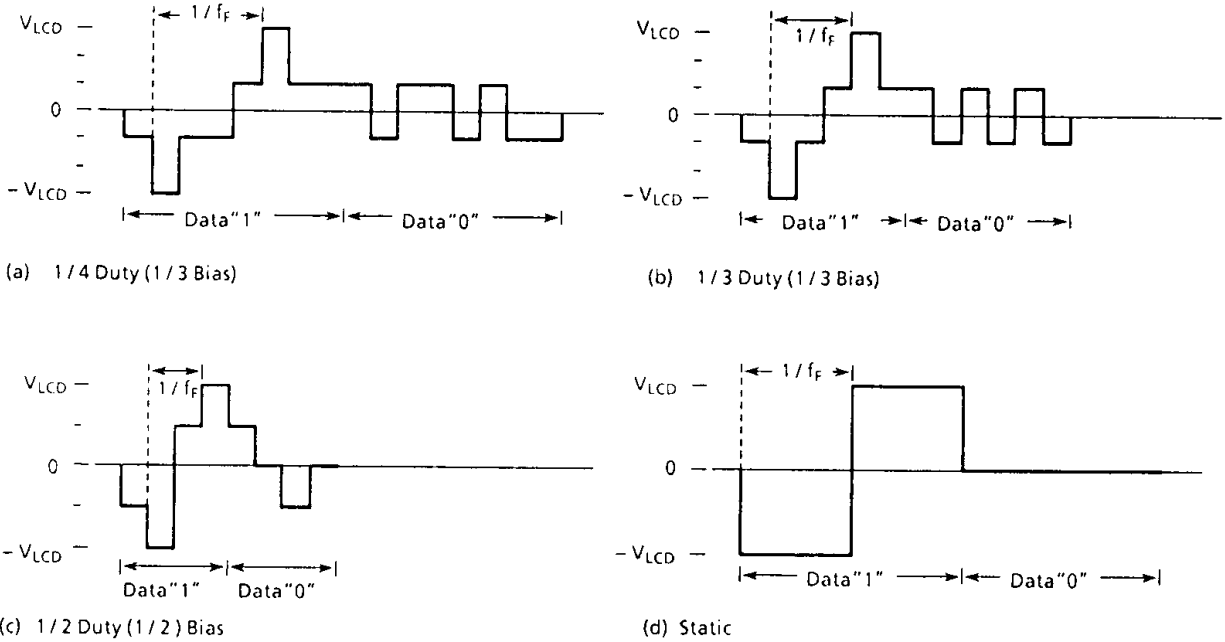

Figure 2-4. LCD driver control command register

(1) Driving methods of LCD driver

4 kinds of driving methods can be selected by DTY (bits 1 and 0 of command register). Figure 2-5 shows driving waveforms for LCD.

Note. f_F ; LCD Frame frequency V_{LCD} ; LCD drive voltage ($= V_{DD} - V_{LC}$)

Figure 2-5. LCD drive waveform (Voltage COM-SEG)

(2) Frame frequency

Frame frequency is set according to the drive method and base frequency as shown in the following table 2-3.

It is possible to select base frequency (either one of 2 kind frequencies obtained from the driver) by SLF (bit 0 of command register 1).

Base frequency [Hz]	Frame Frequency	Frame Frequency [Hz]			
		1/4 Duty	1/3 Duty	1/2 Duty	Static
$\frac{f_c}{2^{15}}$		$\frac{f_c}{2^{15}}$	$\frac{4}{3} \cdot \frac{f_c}{2^{15}}$	$\frac{4}{2} \cdot \frac{f_c}{2^{15}}$	$\frac{f_c}{2^{15}}$
At $f_c = 4\text{MHz}$		128	171	256	128
$\frac{f_c}{2^{14}}$		$\frac{f_c}{2^{14}}$	$\frac{4}{3} \cdot \frac{f_c}{2^{14}}$	$\frac{4}{2} \cdot \frac{f_c}{2^{14}}$	$\frac{f_c}{2^{14}}$
At $f_c = 2.1\text{MHz}$		128	171	256	128

Note. f_c ; Basic clock frequency [Hz]

Table 2-3. Setting of LCD frame frequency

(3) LCD drive voltage

The LCD drive voltage (V_{LCD}) is given by the difference in potential ($V_{DD}-V_{LC}$) between pins VDD and VLC. Therefore, when the CPU operating voltage and LCD drive voltage are the same, the VLC pin is connected to the VSS pin.

The LCD light only when the difference in potential between the segment output and common output is $\pm V_{LCD}$, and turn off at all other times.

During reset, the power switch of the LCD driver is turned off automatically, shutting off the VLC voltage. Both the segment output and common output become VDD level at this time and the LCD turn off.

The power switch is turned on to supply VLC voltage to the LCD driver by setting EDSP (bits 2 and 3 of the command register 2) to "11_B". After that, the power switch will not turn off even during blanking (setting EDSP to "01_B") and the VLC voltage continues to flow.

The power switch is turned off during hold operation low power consumption by turning off the LCD. When hold operation is released, the status in effect immediately before the hold operation is reinstated.

2.3.3 LCD Display Operation

(1) Display data setting

Display data are stored to the display data area (Max. 24 words) in the data memory.

The display data area is set using DBA (bits 1 to 3 of command register 1). During reset, the display data area is set to addresses 80-97_H.

The display data stored to the display data area are read automatically and sent to the LCD driver by the hardware. The LCD driver generates the segment signals and common signals in accordance with the display data and drive method. Therefore, display patterns can be changed by only overwriting the contents of the display data area with a program. The table look-up instruction is mainly used for this overwriting.

Figure 2-6 shows the correspondence between the display data area and the SEG/COM pins. The LCD light when the display data is "1" and turn off when "0".

The number of segment which can be driven differs depending on the LCD drive method, therefore, the number of display data area bits used to store the data also differs. (Refer to Table 2-4) Consequently, data memory not used to store display data and data memory for which the addresses are not connected to LCD can be used to store ordinary user's processing data.

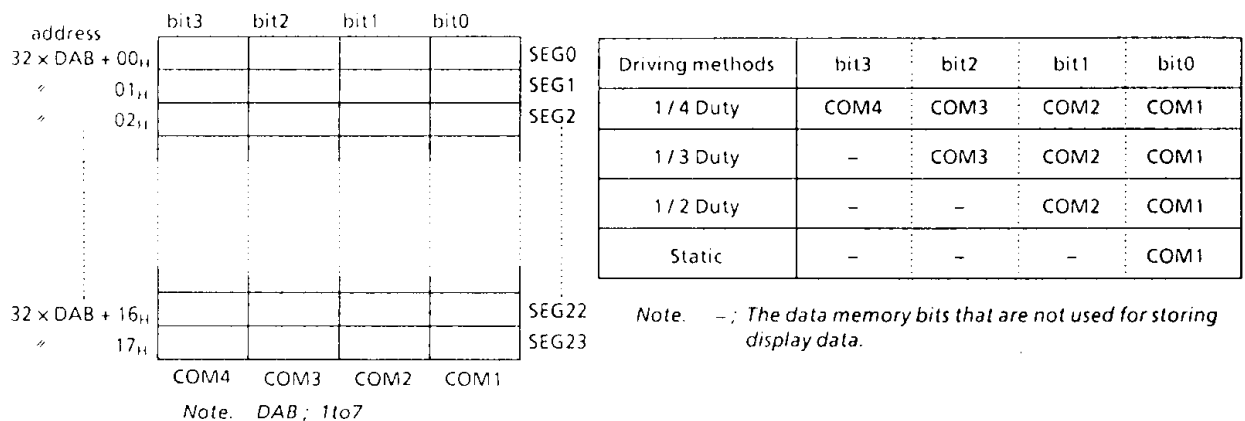

Figure 2-6. The correspondance between the display data area and the SEG/COM pins.

Table 2-4. The data memory bits that are used for driving method and storing display data.

(2) Transfer of display data

The display data stored to the display data area are automatically transferred to the LCD driver. The processing is performed in the following sequence.

- ① The LCD driver issues a display data send request to the CPU.
- ② When the instruction (or timer/counter processing, interrupt receive processing) currently being executed is completed, the CPU reads out the data for one cycle and sends it to the LCD driver.

The data sending cycle is generated when the VLC voltage is being applied to the LCD driver. That is, after reset is canceled, it is not generated until EDSP is set to "11_B". Table 2-5 shows the data sending cycle generation frequency. when LCD display is enabled, the virtual instruction execution speed drops. For example, when SLF = 0 and using 1/4 duty drive, this would be 2.05 μsec. for an instruction execution speed of 2 μsec.

SLF	Driving method	Frequency of data sending cycle insertion
0	Static drive	24 times in 4,096 instruction cycles.
	Except static drive	24 times in 1,024 instruction cycles.
1	Static drive	24 times in 2,048 instruction cycles.
	Except static drive	24 times in 512 instruction cycles.

Table2-5. Frequency of data sending cycle insertion.

(3) Blanking

Blanking is applied by setting EDSP to "01_B" and turns off the LCD by outputting the non light operation level to the COM pin. The SEG pin continuously outputs the signal level in accordance with the display data and drive method.

With static drive, no voltage is applied between the COM and SEG pins when the LCD is turned off by data (display data cleared to "0"), but the COM pin output becomes constant at the $V_{LCD}/2$ level when turning off the LCD by blanking, so the COM and SEG pins are then driven by $V_{LCD}/2$.

2.3.4 Control methods of LCD driver

(1) Initial Setting

Flow chart of initial setting is shown Figure 2-7.

Example : When operating the 47C423A with 1/4 duty LCDs using a frame frequency of $f_c/2^{15}$ [Hz] (display data area at addresses 80-97_H).

```

LD    A, #0000B ; Set the 1/4 duty drive
OUT   A, %OP1B
LD    A, #1000B ; Setting of base frequency, display area in
                ; the data memory.
OUT   A, %OP1A
:
:
LD    A, #1100B ; Display enable (Release of blanking)
OUT   A, %OP1B
    
```

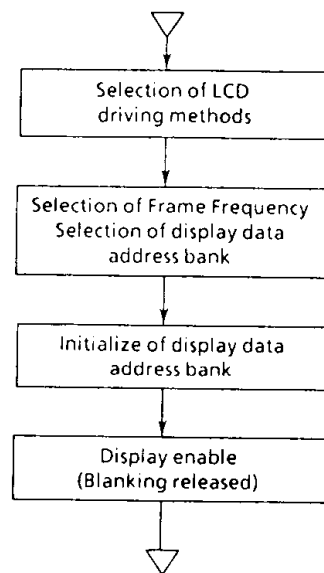

Figure 2-7. Initial set of LCD driver

(2) Store of display data

Normally, display data are kept permanently in the program memory and are then stored to the display data area by the table look-up instruction.

This can be explained using numerical display with 1/4 duty LCD as an example. The COM and SEG connections to the LCD are the same as those shown in Figure 2-8 and the display data are as shown in Table 2-6. Programming example for displaying numerals corresponding to BCD data stored at address 10_H in the data memory is shown below.

```

LD      HL, #0FCH      ; To set the DC

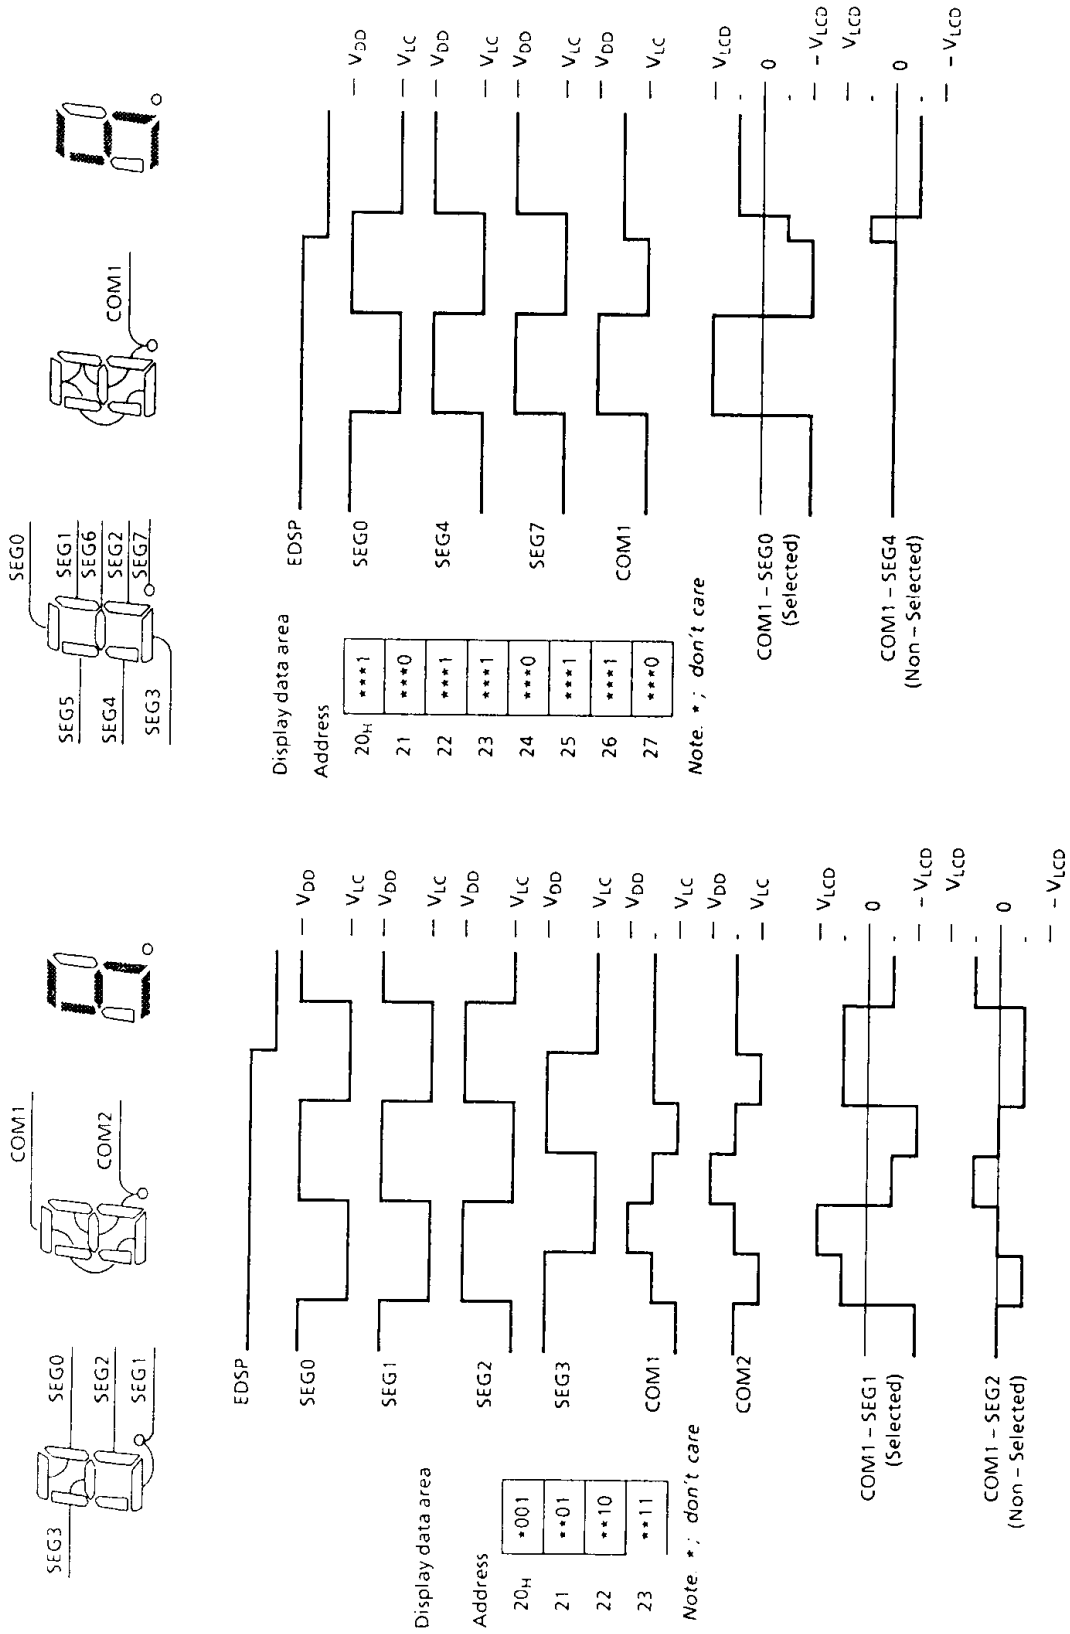

Figure 2-11. Static drive

Figure 2-10. 1/2 Duty (1/2 Bias) Drive

2.4 High Speed Event/Counter (HEC)

The 47C423A has a 16-bit high-speed event counter (HEC) which can be used for ECIN pin input frequency measurement. HEC counts the falling edge of input pulses while the window gate pulse is at "H" level and interrupt requests (ECNT) are generated when the window gate pulse falls.

The window gate pulse cycle is set by command.

The ECIN pin is also used as the R73 pin. When used as the ECIN pin, the R73 output latch is set to "1".

2.4.1 Configuration of HEC circuit

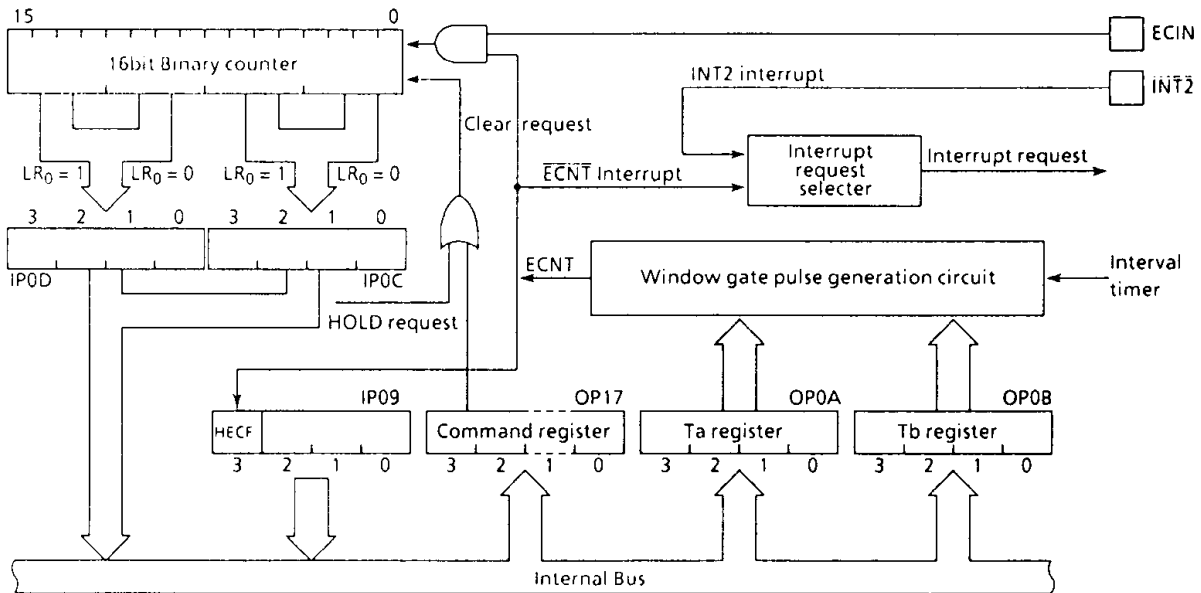

Figure 2-12. Configuration of High Speed Event/Counter

2.4.2 Control of HEC

HEC is controlled by the command register (OP17). External interrupt 2 is used as the interrupt source. The INT2 interrupt request is selected during reset, so ECNT interrupt is requested by command. Interrupt priority is the same as for external interrupt 2.

HEC control command register (port address OP17)

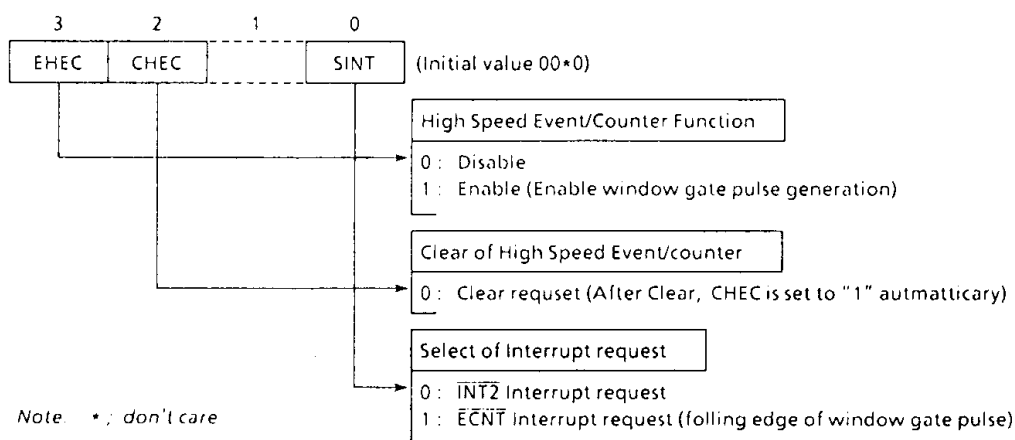

Figure 2-13. HEC Control Command Register

Figure 2-14. HEC Operation status register

2.4.3 HEC Operation

HEC counts input frequency only during the intervals that the window gate pulse is at “H” level when EHEC (command register bit3) is “1”. The window gate pulse can be set to 256 different cycle using port addresses OP0A and OP0B.

(1) Window gate pulse setting

The window gate pulse (ECNT) consists of a count time (Ta) and non-count time (Tb), each of which can be set independently using OP0A and OP0B. Thus, one cycle is Ta + Tb. The Ta and Tb setting times are as follows.

$$(16 - n) \times 2^{13} / f_c \text{ [sec]} \quad (n = 0 \text{ to } 15)$$

Table 2-8 shows the setting times when $f_c = 4.194304\text{MHz}$ ECNT can be generated at the next rise edge of interval timer output ($f_c/2^{13}$ [Hz] by setting EHEC = 1.

Example : Generating ECNT with a cycle of approximately 29ms and a duty ratio of 3:2.

```

OUT  #07H, %OP0A ; Set Ta to 17.58ms
OUT  #0AH, %OP0B ; Set Tb to 11.72msC
LD   A, #0FH
OUT  A, % OP17 ; Enables ECNT generation
    
```

Setting value	Setting time	Setting value	Setting time
0	31.25 ms	8	15.63 ms
1	29.30 ms	9	13.67 ms
2	27.34 ms	A	11.72 ms
3	25.39 ms	B	9.77 ms
4	23.44 ms	C	7.81 ms
5	21.48 ms	D	5.86 ms
6	19.53 ms	E	3.91 ms
7	17.58 ms	F	1.95 ms

Table 2-8. Setting of Ta, Tb

(2) Count operation

Counting is enabled by setting EHEC to "1". Counting is stopped by clearing EHEC to "0" but the binary count values are held.

An INT2 interrupt is issued at the fall edge of the window gate pulse when SINT(command register bit 0) is set to "1". Normally, binary counter data are read, the counter cleared and the next count operation started by the interrupt service routine.

The binary counter is cleared with CHEC (command register bit2). EHEC and the binary counter are cleared during hold operation.

The window gate pulse (ECNT) status can be monitored using the status register. "1" is read out at "H" level (during counting). Figure 2-15 shows the HEC operation timing.

Figure 2-15. HEC Operation Timing

(3) Reading of count data

Binary counter data are read out by port addresses IPOC and IPOD. At that time, a total of 16 bits of data is read out by reading 4 bits at a time in accordance with the LR0 (L register bit 0) value. Table 2-9 shows the relationship between port address LR0 and count data.

Port address	LR ₀	Reading bit of HEC
IPOC	0	HEC3 to HEC0
	1	HEC7 to HEC4
IPOD	0	HEC11 to HEC8
	1	HEC15 to HEC12

Table 2-9. The relationship between port address LR0 or count data

2.5 Pulse output circuit

The 47C423A has a built-in one-channel pulse output to use in driving, for example, a buzzer. Eight different pulse output frequencies can be selected by command. Pulses are output from the PULSE pin. The PULSE pin is also used as the R40 pin. When used as the PULSE pin, the R40 output latch is set to "1".

2.5.1 Configuration of pulse output circuit

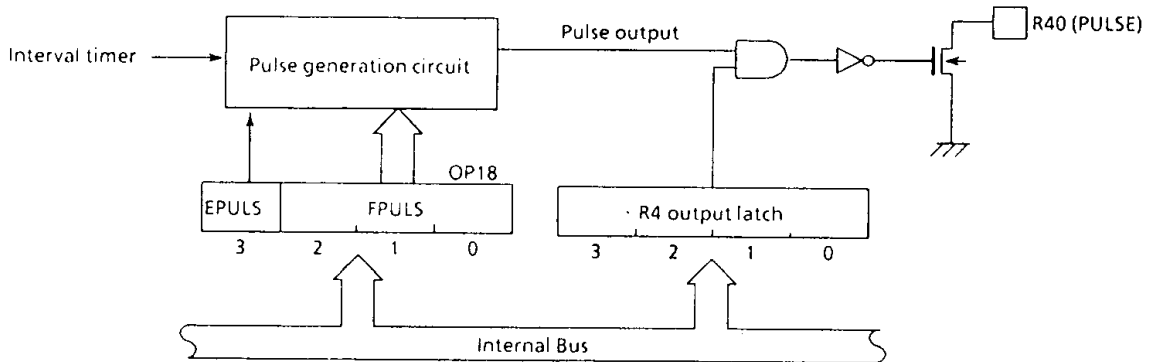

Figure 2-16. Pulse output circuit

2.5.2 Control of pulse output circuit

The pulse output circuit is controlled by the command register (OP18). Pulses are output by setting EPULS to "1". Pulse output is disabled (by clearing OP18 to "0") during hold operation.

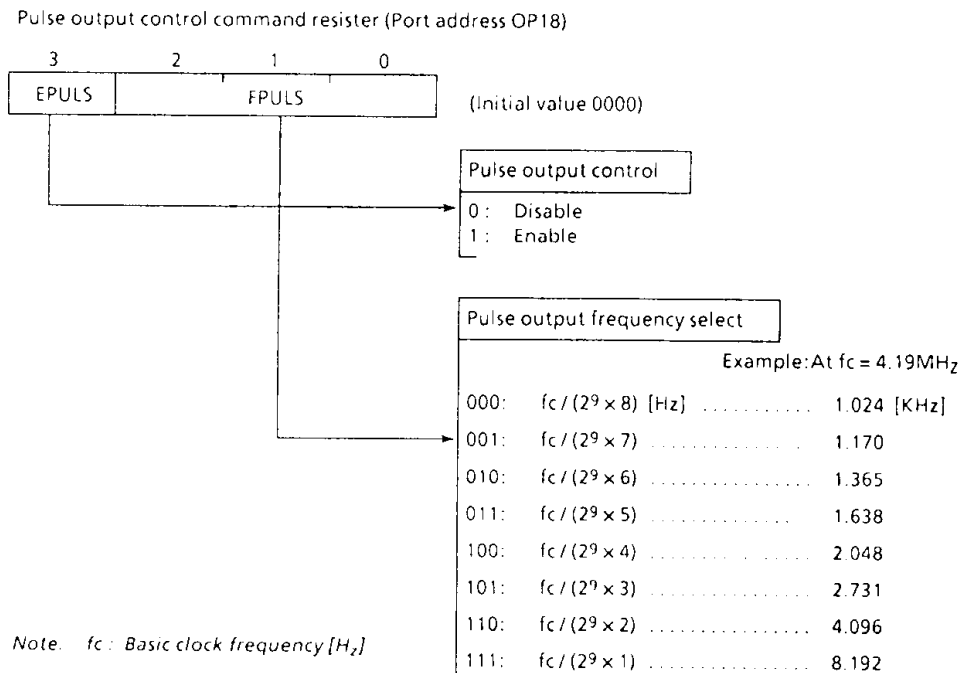

Figure 2-17. Pulse output command register

ELECTRICAL CHARACTERISTICS

ABSOLUTE MAXIMUM RATINGS

(V_{SS} = 0V)

PARAMETER	SYMBOL	PINS	RATING	UNIT
Supply Voltage	V _{DD}		- 0.5 to 7	V
Supply Voltage (LCD drive)	V _{LC}		- 0.5 to V _{DD} + 0.5	V
Input Voltage	V _{IN}		- 0.5 to V _{DD} + 0.5	V
Output Voltage	V _{OUT1}	Except sink open drain pin	- 0.5 to V _{DD} + 0.5	V
	V _{OUT2}	Sink open drain pin	- 0.5 to 10	
Output Current (Per 1pin)	I _{OUT1}	Except port R4	3.2	mA
	I _{OUT2}	Ports R40,R41	30	
	I _{OUT3}	Ports R42,R43	- 30	
Power Dissipation [T _{opr} = 70°C]	PD		600	mW
Soldering Temperture (time)	T _{slrd}		260 (10sec)	°C
Storage Temperature	T _{stg}		- 55 to 125	°C
Operating Temperature	T _{opr}		- 30 to 70	°C

RECOMMENDED OPERATING CONDITIONS

(V_{SS} = 0V, T_{opr} = - 30 to 70°C)

PARAMETER	SYMBOL	PINS	CONDISIONS	Min.	Max.	UNIT
Supply Voltage	V _{DD}		in the Normal mode	4.5	6.0	V
			in the Hold mode	2.0		
Input High Voltage	V _{IH1}	Except Hysteresis Input	V _{DD} ≥ 4.5V	V _{DD} × 0.7	V _{DD}	V
	V _{IH2}	Hysteresis Input		V _{DD} × 0.75		
	V _{IH3}		V _{DD} < 4.5V	V _{DD} × 0.9		
Input Low Voltage	V _{IL1}	Except Hysteresis Input	V _{DD} ≥ 4.5V	0	V _{DD} × 0.3	V
	V _{IL2}	Hysteresis Input			V _{DD} × 0.25	
	V _{IL3}		V _{DD} < 4.5V		V _{DD} × 0.1	
Clock Frequency	f _c			0.4	4.2	MHz

Note1. Input Voltage V_{IH3}, V_{IL3} in the HOLD mode.

Note2. f_c: 1MHz is recommended as minimum frequency when SLF = 1. And 2MHz is when SLF = 0

D.C. CHARACTERISTICS

 $(V_{SS} = 0V, T_{opr} = -30 \text{ to } 70^{\circ}C)$

PARAMETER	SYMBOL	PINS	CONDITIONS	Min.	Typ.	Max.	UNIT
Hysteresis Voltage	V_{HS}	Hysteresis Input		—	0.7	—	V
Input Current	I_{IN1}	Port K0, TEST, RESET, HOLD	$V_{DD} = 5.5V,$	—	—	± 2	μA
	I_{IN2}	Port R (Open drain)	$V_{IN} = 5.5V / 0V$				
Input Low Current	I_{iL}	Port R (push-pull)	$V_{DD} = 5.5V, V_{IN} = 0.4V$	—	—	—2	mA
Input Resistance	R_{IN1}	port K0 with pull-up/pull-down		30	70	150	K Ω
	R_{IN2}	RESET		100	220	450	
Output Leakage Current	I_{LO}	Port R (Open drain)	$V_{DD} = 5.5V, V_{OUT} = 5.5V$	—	—	2	μA
Output High Voltage	V_{OH}	Port R (Push-pull)	$V_{DD} = 4.5V, I_{OH} = -200\mu A$	2.4	—	—	V
Output Low Voltage	V_{OL2}	Except XOUT	$V_{DD} = 4.5V, I_{OL} = 1.6mA$	—	—	0.4	V
Output High Voltage	I_{OH}	Ports R42, R43	$V_{DD} = 4.5V, V_{OH} = 3.5V$	—15	—20	—	mA
Output Low Voltage	I_{OL}	Ports R40, R41	$V_{DD} = 4.5V, V_{OL} = 1.0V$	15	20	—	mA
Segment Output Resistance	R_{OS}	SEG pin	$V_{DD} = 5V, V_{DD} - V_{LC} = 3V$	—	20	—	K Ω
Common Output Resistance	R_{OC}	COM pin					
Segment/Common Output Voltage	$V_{O2/3}$	SEG/COM pin		3.8	4.0	4.2	
	$V_{O1/2}$		3.3	3.5	3.7		
	$V_{O1/3}$		2.8	3.0	3.2		
Supply Current (in the Normal mode)	I_{DD}		$V_{DD} = 5.5V, V_{LC} = V_{SS}, f_c = 4MHz$	—	3	6	mA
Supply Current (in the HOLD mode)	I_{DDH}		$V_{DD} = 5.5V$	—	0.5	10	μA

Note 1. Typ. Values show those at $T_{opr} = 25^{\circ}C, V_{DD} = 5V.$

Note 2. When the K0 Port has a pull-up/pull-down resistor, current by resistor is excluded.

Note 3. $V_{LCD} = V_{DD} - V_{LC}$

Note 4. Shows on-resistance at time of level switching when the 1/4 or 1/3 duty LCD is used.

Note 5. Shows on-resistance at time of level switching when the 1/2 duty or static LCD is used.

Note 6. When K0 port has A built-in input resistor, current value is that at time of open. Further, voltage level at R port is valid.

AC CHARACTERISTICS

($V_{SS} = 0V$, $V_{DD} = 4.5$ to $6.0V$, $T_{opr} = -30$ to $70^{\circ}C$)

PARAMETER	SYMBOL	CONDITIONS	Min.	Typ.	Max.	UNIT
INSTRUCTION Cycle Time	t_{cy}		1.9	—	20	μs
High level Clock pulse width	t_{WCH}	For external clock operation	80	—	—	ns
Low level Clock pulse width	t_{WCL}					
HEC Input Frequency	f_{HEC}	ECIN Input	—	—	f_c	Hz
Shift data Hold Time	t_{SDH}		$0.5t_{cy} - 300$	—	—	ns

Note. Shift data Hold Time :

External circuit for $\bar{S}\bar{C}\bar{K}$ pin and SO pin

Serial port (completion of transmission)

RECOMMENDED OSCILLATING CONDITIONS

($V_{SS} = 0V$, $V_{DD} = 4.5$ to $6.0V$, $T_{opr} = -30$ to $70^{\circ}C$)

(1) 4MHz

Ceramic Resonator

- CSA4.00MG (MURATA) $C_{XIN} = C_{XOUT} = 30pF$
- KBR-4.00MS (KYOCERA) $C_{XIN} = C_{XOUT} = 30pF$

Crystal Oscillator

- 204B-6F 4.0000 (TOYOCOM) $C_{XIN} = C_{XOUT} = 20pF$

(2) 400KHz

Ceramic Resonator

- CSB400B (MURATA) $C_{XIN} = C_{XOUT} = 220pF$, $R_{XOUT} = 6.8K\Omega$
- KBR-400B (KYOCERA) $C_{XIN} = C_{XOUT} = 100pF$, $R_{XOUT} = 10K\Omega$

TYPICAL CHARACTERISTICS

Input/Output Circuitry

(1) Control pins

Input/Output circuitries of the 47C423A control pins are similar to the 47C400A.

(2) I/O Ports

The input/output circuitries of the 47C423A I/O port are shown below, any one of the circuitries can be shown by a code (GA to GF) as mask option.

Port	I/O	input/output Circuitry (Code)			
		GA, GD	GB, GE	GC, GF	
K0	input				pull-up/pull-down resistor R _{IN} = 70KΩ (typ.) R = 1KΩ (typ.)
R40 R41	I/O				Sink open drain output Initial "Hi-Z" High current I _{OL} = 20mA (typ.) R = 1KΩ (typ.)
R42 R43	I/O				Source open drain output Initial "Hi-Z" High current I _{OH} = -20mA (typ.) R = 1KΩ (typ.)
R5 R6	I/O	GA, GB, GC Initial "Hi-Z" 	GD, GE, GF Initial "High" 	Sink open drain or push-pull output R = 1KΩ (typ.)	
R7	I/O				Sink open drain output Initial "Hi-Z" R = 1KΩ (typ.)
R8 R9	I/O				Sink open drain output Initial "Hi-Z" Hysteresis input R = 1KΩ (typ.)
