TQ1089

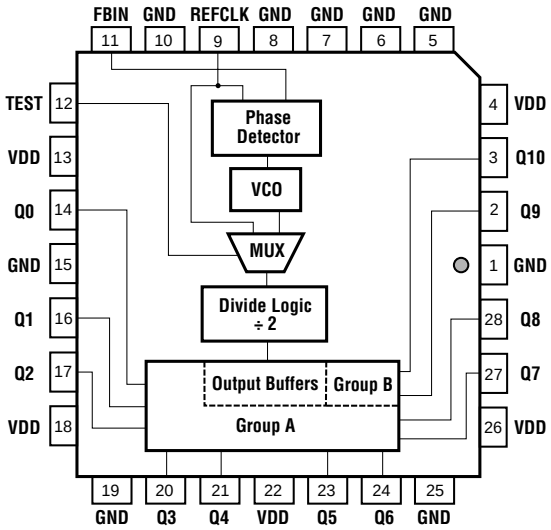
11-Output Configurable Clock Buffer

Features

- *Wide frequency range: 65 MHz to 90 MHz and 130 MHz to 180 MHz*
- *Output configurations: eight outputs at f_{REF} two outputs at 2x f_{REF} or nine outputs at $^1/_2$ x f_{REF} one output at f_{REF}*
- *Low output-to-output skew: 150 ps (max) within a group*
- *Near-zero propagation delay –350 ps ± 500 ps (max) or –350 ps ±700 ps (max)*
- *TTL–compatible with 30 mA output drive*
- *28–pin J–lead surface–mount package*
- *Ideal for PowerPC™–based designs*

SYSTEM TIMING PRODUCTS

Figure 1. Block Diagram



TriQuint's TQ1089 is a configurable clock buffer which generates 11 outputs, operating over a wide range of frequencies from 65 MHz to 90 MHz and from 130 MHz to 180 MHz. The outputs are available at either 1x and 2x or at 1x and $^1/_2$ x the reference clock frequency, f_{REF} . When one of the Group A outputs (Q0–Q8) is used as feedback to the PLL, all Group A outputs will be at f_{REF} , and all Group B outputs (Q9, Q10) will be at 2x f_{REF} . When one of the Group B outputs is used as feedback to the PLL, all Group A outputs will be at $^1/_2$ x f_{REF} and all Group B outputs will be at f_{REF} .

A very stable internal Phase-Locked Loop (PLL) provides low-jitter operation. This completely self-contained PLL requires no external capacitors or resistors. The PLL's Voltage-Controlled Oscillator (VCO) has a frequency range from 260 MHz to 360 MHz. By feeding back one of the output clocks to FBIN, the PLL continuously maintains frequency and phase synchronization between the reference clock (REFCLK) and each of the outputs.

TriQuint's patented output buffer design delivers a very low output-to-output skew of 150 ps (max). The TQ1089's symmetrical TTL outputs are capable of sourcing and sinking 30 mA.

Functional Description

The core of the TQ1089 is a Phase-Locked Loop (PLL) that continuously compares the reference clock (REFCLK) to the feedback clock (FBIN), maintaining a zero frequency difference between the two. Since one of the outputs is always connected to FBIN, the PLL keeps the propagation delay between the outputs and the reference clock within –350 ps $\pm$500 ps for the TQ1089–MC500, and within –350 ps $\pm$700 ps for the TQ1089–MC700.

The internal Voltage-Controlled Oscillator (VCO), has an operating range of 260 MHz to 360 MHz, as shown in Table 1. The combination of the VCO and the Divide Logic enables the TQ1089 to operate between 65 MHz and 90 MHz and from 130 MHz to 180 MHz.

In the test mode, the PLL is bypassed and REFCLK is connected directly to the Divide Logic block via the MUX, as shown in Figure 1. This mode is useful for debug and test purposes. The test mode is outlined in Table 2.

The maximum rise and fall time at the output pins is 1.4 ns. All outputs of the TQ1089 are TTL-compatible with 30 mA symmetric drive and a minimum V_{OH} of 2.4 V.

Power Up/Reset Synchronization

After power up or reset, the PLL requires time before it achieves synchronization lock. The maximum time required for synchronization (TSYNC) is 500 ms.

Table 1. Frequency Mode Selection

Test	Output Feedback	Mode	Reference Clock Frequency Range	Output Frequency Range Group A: Q0–Q8	Output Frequency Range Group B: Q9,Q10
0	Group B	÷ 2	130 MHz – 180 MHz	65 MHz – 90 MHz	130 MHz – 180 MHz
0	Group A	÷ 4	65 MHz – 90 MHz	65 MHz – 90 MHz	130 MHz – 180 MHz

Table 2. Test Mode Selection

Test	Mode	Ref. Clock	Group A Outputs Q0–Q8	Group B Outputs Q9, Q10
1	÷ 2	f_{REF}	$f_{REF} \div 4$	$f_{REF} \div 2$

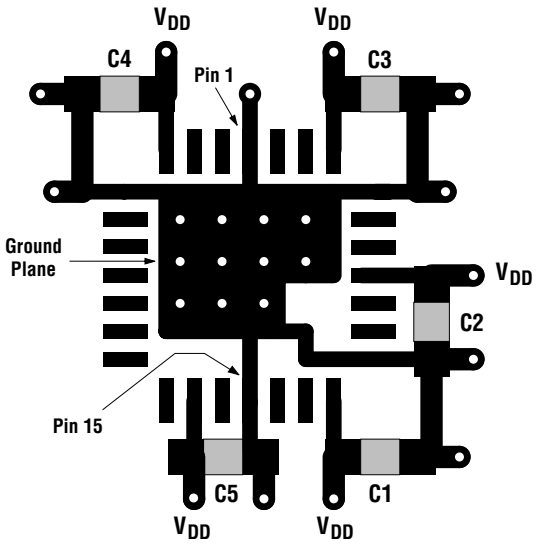
Layout Guidelines

Multiple ground and power pins on the TQ1089 reduce ground bounce. Good layout techniques, however, are necessary to guarantee proper operation and to meet the specifications across the full operating range. TriQuint recommends bypassing each of the V_{DD} supply pins to the nearest ground pin, as close to the chip as possible.

Figure 2 shows the recommended power layout for the TQ1089. The bypass capacitors should be located on the same side of the board as the TQ1089. The V_{DD} traces connect to an inner-layer V_{DD} plane. All of the ground pins (GND) are connected to a small ground plane on the surface beneath the chip. Multiple through holes connect this small surface plane to an inner-layer ground plane. The capacitors (C1–C5) are 0.1 mF. TriQuint's test board uses X7R temperature-stable capacitors in 1206 SMD cases.

Figure 2. Top Layer Layout of Power Pins

(Approx. 3.3x)



Absolute Maximum Ratings [1]

Storage temperature	–65 °C to +150 °C
Ambient temperature with power applied[2]	–55 °C to +100 °C
Supply voltage to ground potential	–0.5 V to +7.0 V
DC input voltage	–0.5 V to +(V_{DD} + 0.5)V
DC input current	–30 mA to +5 mA
Package thermal resistance (MQuad)	θ_{JA} = 45 °C/W
Die junction temperature	T_J = 150 ° C

DC Characteristics

(V_{DD} = +5 V ± 5%, T_A = 0 °C to +70 °C) [3]

			Limits [4]			
Symbol	***Description***	***Test Conditions***	***Min***	***Typ***	***Max***	***Unit***
V_{OHT}	Output HIGH voltage	V_{DD} = Min I_{OH}= –30 mA V_{IN}= V_{IH} or V_{IL}	2.4	3.4		V
V_{OHC}	Output HIGH voltage	V_{DD} = Min I_{OH}= –1 mA V_{IN}= V_{IH} or V_{IL}	3.2	4.1		V
V_{OL}	Output LOW voltage	V_{DD} = Min I_{OL} = 30 mA V_{IN}= V_{IH} or V_{IL}		0.27	0.5	V
V_{IH} [5]	Input HIGH level	Guaranteed input logical HIGH Voltage for all Inputs	2.0			V
V_{IL} [5]	Input LOW level	Guaranteed input logical LOW Voltage for all inputs			0.8	V
I_{IL}	Input LOW current	V_{DD} = Max V_{IN} = 0.40 V		–156	–400	µA
I_{IH}	Input HIGH current	V_{DD} = Max V_{IN} = 2.7 V		0	25	µA
I_I	Input HIGH current	V_{DD} = Max V_{IN} = 5.5 V		2	1000	µA
I_{DDS} [6]	Power supply current	V_{DD} = Max		119	170	mA
V_I	Input clamp voltage	V_{DD} = Min I_{IN} = –18 mA		–0.70	–1.2	V

Capacitance

Symbol	***Description***	***Test Conditions***	***Min***	***Typ***	***Max***	***Unit***
C_{IN} [3,7]	Input capacitance	V_{IN} = 2.0 V at f = 1 MHz		6		pF

Notes: 1. Exceeding these parameters may damage the device.
2. Maximum ambient temperature with device not switching and unloaded.
3. These values apply to both TQ1089-MC500 and TQ1089-MC700.
4. Typical limits are at V_{DD} = 5.0 V and T_A = 25 °C.
5. These are absolute values with respect to device ground and all overshoots due to system or tester noise are included.
6. This parameter is measured with device not switching and unloaded.
7. These parameters are not 100% tested, but are periodically sampled.

AC Characteristics

(V_{DD} = +5 V ± 5%, T_A = 0 °C to +70 °C)

Symbol	*Input Clock (REFCLK)*	*Test Conditions (Figure 3)* [1]	*Min*	*Typ*	*Max*	*Unit*

t_{SKEW2} [3]	Rise–rise, fall–fall (group-to-group, aligned)	Figure 6 (skew 2 takes into account skew 1)	—	75	350	ps
t_{SKEW3} [3]	Rise-rise, fall-fall (group-to-group, non-aligned)	Figure 7 (skew 3 takes into account skews 1, 2)	—	—	650	ps
t_{SKEW4} [3]	Rise–fall, fall–rise	Figure 8 (skew 4 takes into account skew 3)	—	—	1200	ps
t_{CYC} [4]	Duty-cycle Variation	Figure 4	–1000	0	+1000	ps
t_{JP} [5]	Period-to-Period Jitter	Figure 4	—	80	200	ps
t_{JR} [5]	Random Jitter	Figure 4	—	190	400	ps
t_{SYNC} [6]	Synchronization Time		—	10	500	µs

Notes: 1. All measurements are tested with a REFCLK having a rise time of 0.5 ns (0.8 V to 2.0 V).

2. The PLL maintains alignment of CLK and FBIN at all times. This specification applies to the rising edge only because the input duty cycle can vary while the output duty cycle is typically 50/50. The delay t_{PD} is measured at the 1.5 V level between CLK and FBIN.

3. Skew specifies the width of the window in which outputs switch, and is measured at 1.5 V.

4. This specification represents the deviation from 50/50 on the outputs.

5. Jitter specifications refer to peak-to-peak value. t_{JR} is the jitter on the output with respect to the reference clock. t_{JP} is the jitter on the output with respect to the output's previous rising edge.

6. t_{SYNC} is the time required for the PLL to synchronize; this assumes the presence of a CLK signal and a connection from one of the outputs to FBIN.
